

List of evaluation methods Separate train and test set K-fold cross validation Leave one out used with very small datasets (few 10 examples) For each example e: use e as test example and the rest for training Count the correctly classified examples Optimistic estimate: test on training set Random sampling

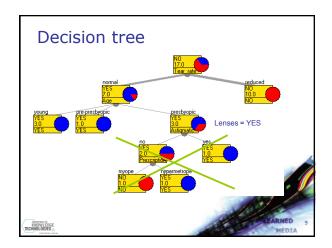

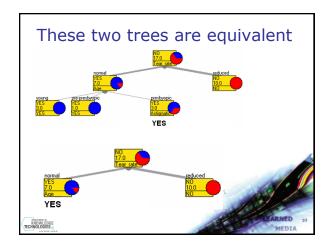

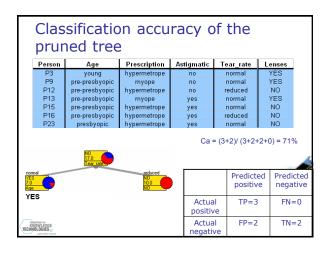

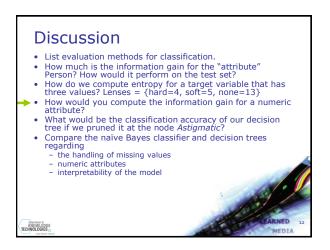

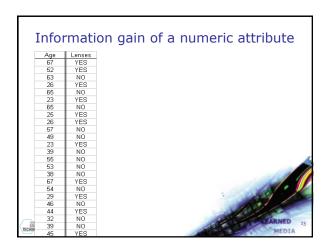

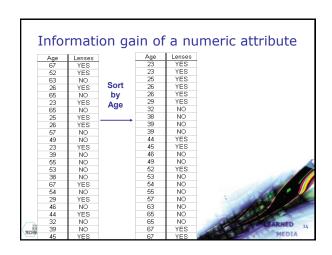

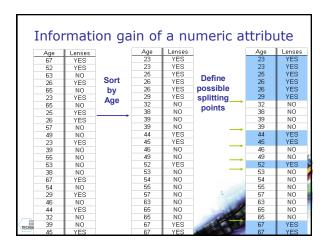

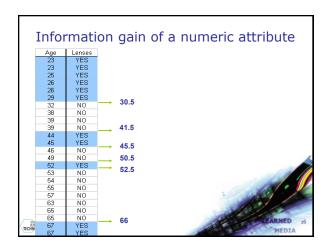

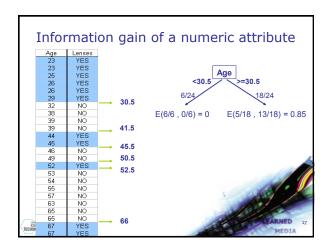

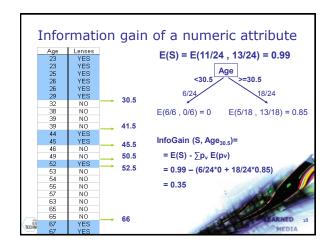

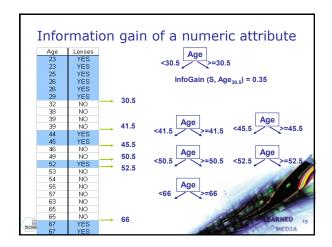

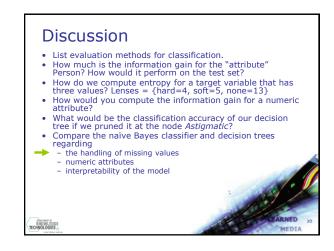

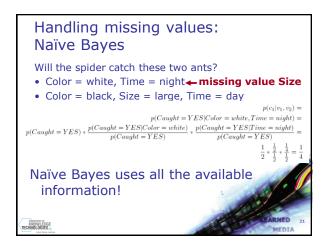

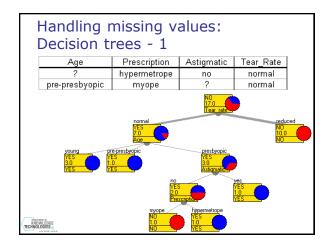

Handling missing values:
Decision trees - 2

Algorithm ID3: does not handle missing values
Algorithm C4.5 (J48) deals with two problems:

• Missing values in train data:

- Missing values are not used in gain and entropy calculations

• Missing values in test data:

- A missing continuous value is replaced with the median of the training set

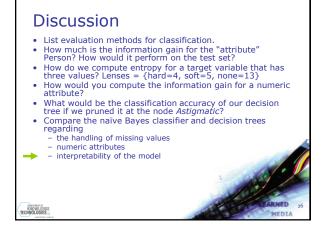

- A missing categorical values is replaced with the most frequent value

Continuous attributes: decision trees & naïve bayes

- Decision trees ID3 algorithm: does not handle continuous attributes → data need to be discretized
- Decision trees C4.5 (J48 in Weka) algorithm: deals with continuous attributes as shown earlier
- Naïve Bayes: does not handle continuous attributes → data need to be discretized

(some implementations do handle)

Interpretability of decision tree and naïve bayes models

- Decision trees are easy to understand and interpret (if they are of a reasonable size)
- Naïve bayes models are of the "black box type".
 Naïve bayes models have been visualized by nomograms.
