### **Data Mining** and Knowledge Discovery

Part of "New Media and e-Science" M.Sc. Programme and "Statistics" M.Sc. Programme

### 2008 / 2009

### Nada Lavrač

Jožef Stefan Institute Ljubljana, Slovenia

### Course participants

- **IPS** students
- Aleksovski
- Bole
- Cimperman Dali
- Dervišević
- Djuras
- Dovgan Kaluža
- Mirčevska
- Pollak
- Rusu
- Tomašev
- Tomaško
- Vukašinović Zenkovič

- II. Statistics students
- Breznik
- Korošec
- Limbek Ostrež

### Course Schedule - 2007/08 **Data Mining and Knowledge Discovery (DM)**

• 21 October 2008 15-19 Lectures (Lavrač)

• 22 October 2008 15-19 Practice (Kralj Novak)

 11 November 2008 15-19 Lectures (Lavrač)

• 12 November 2008 15-19 Practice (Kralj Novak)

• 1 December 2008 16-17 written exam - theory

• 8 December 2008 15-17 seminar topics presentations

• 14 January 2009 15-19 seminar presentations (exam ?)

· Spare date, if needed:

(28 January 2009 15-19 seminar presentations?, exam?)

http://kt.ijs.si/petra\_kralj/IPSKnowledgeDiscovery0809.html

### **DM - Credits and coursework**

"New Media and eScience" / "Statistics"

- 12 credits (30 hours / 36 hours)
- · Lectures
- · Practice
  - Theory exercises and hands-on (WEKA)
- · Seminar choice:
  - Data analysis of your own data (e.g., using WEKA for questionnaire data analysis)
  - Programming assignment write your own data mining module, and evaluate it on a (few) domain(s)
- - Nada Lavrač nada.lavrac@ijs.si
  - Petra Kralj Novak petra.kralj@ijs.si

### **DM** - Credits and coursework

Exam: Written exam (60 minutes) - Theory

### Seminar: topic selection + results presentation

- · Oral presentations of your seminar topic (DM task or dataset presentation, max. 4 minutes)
- · Presentation of your seminar results (10 minutes + discussion)
- Deliver written report + electronic copy (in Information Society paper format, see instructions on the web page),
  - Report on data analysis of own data needs to follow the CRISP-DM methodology
  - Report on DM SW development needs to include SW uploaded on a Web page - format to be announced

http://kt.ijs.si/petra\_kralj/IPSKnowledgeDiscovery0809.html

### **Course Outline**

### I. Introduction

- Data Mining and KDD process
   DM standards, tools and visualization
- Classification of Data Mining techniques: Predictive and descriptive DM (Mladenić et al. Ch. 1 and 11, Kononenko & Kukar Ch. 1)

### II. Predictive DM Techniques

- Bayesian classifier (Kononenko Ch. 9.6)
- 3, Kononenko Ch. 9.1) Classification rule learning (Berthold book Ch. 7, Kononenko Ch. 9.2)
- Classifier Evaluation (Bramer Ch. 6)

### III. Regression

(Kononenko Ch. 9.4)

### IV. Descriptive DM

- Predictive vs. descriptive induction
- Subgroup discovery
  Association rule learning
- (Kononenko Ch. 9.3)
- Hierarchical clustering (Kononenko Ch. 12.3)

### V. Relational Data Mining

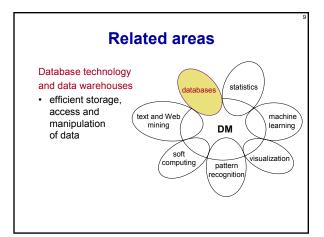

- RDM and Inductive Logic Programming (Dzeroski & Lavrac Ch. 3, Ch. 4)
- Propositionalization approaches
- Relational subgroup discovery

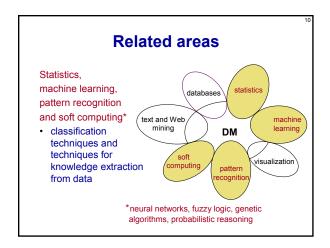

### Part I. Introduction

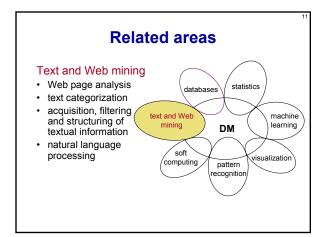

- Data Mining and the KDD process
- · DM standards, tools and visualization
- Classification of Data Mining techniques: Predictive and descriptive DM

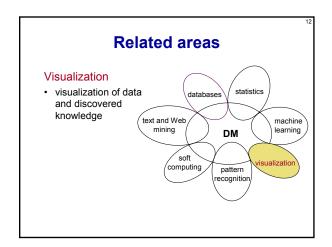

### What is DM

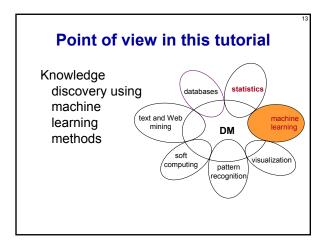

- Extraction of useful information from data: discovering relationships that have not previously been known
- The viewpoint in this course: Data Mining is the application of Machine Learning techniques to solve real-life data analysis problems

### **Data Mining, ML and Statistics**

- All areas have a long tradition of developing <u>inductive</u> <u>techniques</u> for data analysis.
  - reasoning from properties of a data sample to properties of a population
- DM vs. ML Viewpoint in this course:
  - Data Mining is the application of Machine Learning techniques to hard real-life data analysis problems
- DM vs. Statistics:
  - Statistics
    - Hypothesis testing when certain theoretical expectations about the data distribution, independence, random sampling, sample size, etc. are satisfied
    - · Main approach: best fitting all the available data
  - Data mining
    - Automated construction of understandable patterns, and structured models
    - Main approach: structuring the data space, heuristic search for decision trees, rules, ... covering (parts of) the data space

### **Data Mining and KDD**

- KDD is defined as "the process of identifying valid, novel, potentially useful and ultimately understandable models/patterns in data." \*
- Data Mining (DM) is the key step in the KDD process, performed by using data mining techniques for extracting models or interesting patterns from the data.

Usama M. Fayyad, Gregory Piatesky-Shapiro, Pedhraic Smyth: The KDD Process for Extracting Useful Knowledge form Volumes of Data. Comm ACM, Nov 96/Vol 39 No 11

# KDD Process KDD process of discovering useful knowledge from data Selection Preprocessing Frans- Data Interpretation/ Mining Patterns Knowledge from data Frans- Preprocessed Transformed Patterns Knowledge from data

- KDD process involves several phases:
  - data preparation
  - data mining (machine learning, statistics)
  - · evaluation and use of discovered patterns
- Data mining is the key step, but represents only 15%-25% of the entire KDD process

### MEDIANA – analysis of media research data

- Questionnaires about journal/magazine reading, watching of TV programs and listening of radio programs, since 1992, about 1200 questions. Yearly publication: frequency of reading/listening/watching, distribution w.r.t. Sex, Age, Education, Buying power,...
- Data for 1998, about 8000 questionnaires, covering lifestyle, spare time activities, personal viewpoints, reading/listening/watching of media (yes/no/how much), interest for specific topics in media, social status
- good quality, "clean" data
- table of n-tuples (rows: individuals, columns: attributes, in classification tasks selected class)

### MEDIANA - media research pilot study

- · Patterns uncovering regularities concerning:
  - Which other journals/magazines are read by readers of a particular journal/magazine?
  - What are the properties of individuals that are consumers of a particular media offer ?
  - Which properties are distinctive for readers of different iournals?
- Induced models: description (association rules, clusters) and classification (decision trees, classification rules)

### Simplified association rules

Finding profiles of readers of the Delo daily newspaper

- 1. read\_Marketing\_magazine 116 => read\_Delo 95 (0.82)
- 2. read\_Financial\_News (Finance) 223 => read\_Delo 180 (0.81)
- 3. read\_Views (Razgledi) 201 => read\_Delo 157 (0.78)
- 4. read\_Money (Denar) 197 => read\_Delo 150 (0.76)
- 5. read\_Vip 181 => read\_Delo 134 (0.74)

Interpretation: Most readers of Marketing magazine, Financial News, Views, Money and Vip read also

# Simplified association rules (in Slovene)

- 1. bere\_Sara 332 => bere\_Slovenske novice 211 (0.64)
- 2. bere\_Ljubezenske zgodbe 283 => bere\_Slovenske novice 174 (0.61)
- 3. bere\_Dolenjski list 520 =>
  - bere\_Slovenske novice 310 (0.6)
- 4. bere\_Omama 154 => bere\_Slovenske novice 90 (0.58)
- 5. bere Delavska enotnost 177 =>

bere Slovenske novice 102 (0.58)

Večina bralcev Sare, Ljubezenskih zgodb, Dolenjskega lista, Omame in Delavske enotnosti bere tudi Slovenske novice.

# Simplified association rules (in Slovene)

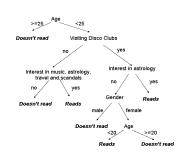

- 1. bere\_Sportske novosti 303 =>
  - bere\_Slovenski delnicar 164 (0.54)
- 2. bere\_Sportske novosti 303 =>
  - bere Salomonov oglasnik 155 (0.51)
- 3. bere\_Sportske novosti 303 =>

bere\_Lady 152 (0.5)

Več kot pol bralcev Sportskih novosti bere tudi Slovenskega delničarja, Salomonov oglasnik in Lady.

### **Decision tree**

Finding reader profiles: decision tree for classifying people into readers and non-readers of a teenage magazine.

### Part I. Introduction

Data Mining and the KDD process

DM standards, tools and visualization

 Classification of Data Mining techniques: Predictive and descriptive DM

### **CRISP-DM**

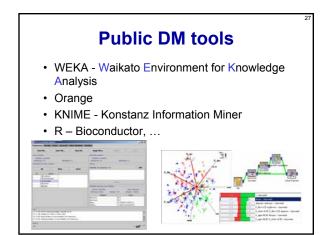

- · Cross-Industry Standard Process for DM
- A collaborative, 18-months partially EC founded project started in July 1997
- NCR, ISL (Clementine), Daimler-Benz, OHRA (Dutch health insurance companies), and SIG with more than 80 members
- · DM from art to engineering
- Views DM more broadly than Fayyad et al. (actually DM is treated as KDD process):

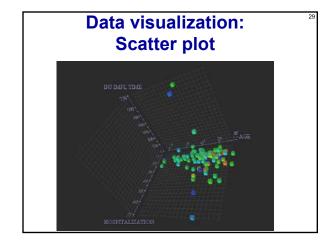

N # #

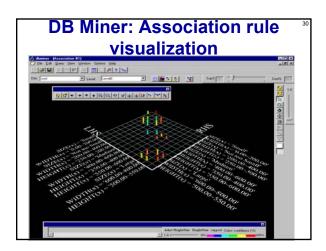

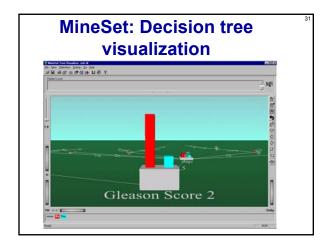

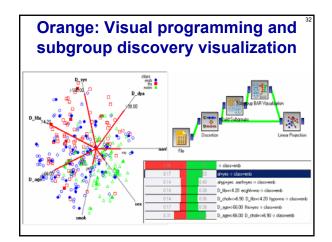

# Visualization • can be used on its own (usually for description and summarization tasks) • can be used in combination with other DM techniques, for example – visualization of decision trees – cluster visualization – visualization of association rules – subgroup visualization

### Part I. Introduction

Data Mining and the KDD process

- DM standards, tools and visualization
- Classification of Data Mining techniques: Predictive and descriptive DM

### Types of DM tasks

· Predictive DM:

- Classification (learning of rules, decision trees, ...)
- Prediction and estimation (regression)Predictive relational DM (ILP)
- · Descriptive DM:
  - description and summarization
  - dependency analysis (association rule learning)
  - discovery of properties and constraints
  - segmentation (clustering)
  - subgroup discovery
- Text, Web and image analysis

# Predictive vs. descriptive induction Predictive induction Descriptive induction

# Predictive vs. descriptive induction

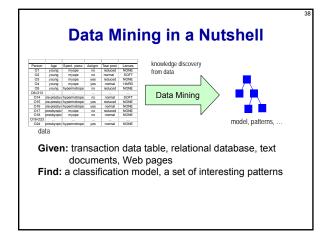

- **Predictive induction:** Inducing classifiers for solving classification and prediction tasks,
- Classification rule learning, Decision tree learning, ...
- Bayesian classifier, ANN, SVM, ...
- Data analysis through hypothesis generation and testing
- Descriptive induction: Discovering interesting regularities in the data, uncovering patterns, ... for solving KDD tasks
  - Symbolic clustering, Association rule learning, Subgroup discovery, ...
  - Exploratory data analysis

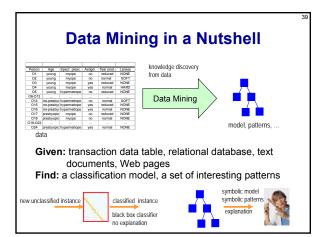

# Predictive DM formulated as a machine learning task:

 Given a set of labeled training examples (n-tuples of attribute values, labeled by class name)

 By performing generalization from examples (induction) find a hypothesis (classification rules, decision tree, ...) which explains the training examples, e.g. rules of the form:

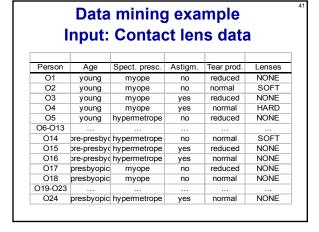

$$(A_i = v_{i,k}) & (A_i = v_{i,l}) & ... \rightarrow Class = C_n$$

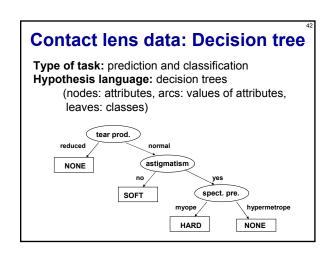

### **Predictive DM - Classification**

- data are objects, characterized with attributes they belong to different classes (discrete labels)
- given objects described with attribute values, induce a model to predict different classes
- decision trees, if-then rules, discriminant analysis, ...

# Contact lens data: Classification rules

Type of task: prediction and classification

Hypothesis language: rules X → C, if X then C

X conjunction of attribute values, C class

tear production=reduced → lenses=NONE
tear production=normal & astigmatism=yes &
 spect. pre.=hypermetrope → lenses=NONE
tear production=normal & astigmatism=no →
lenses=SOFT

tear production=normal & astigmatism=yes & spect. pre.=myope → lenses=HARD DEFAULT lenses=NONE

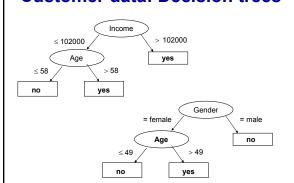

## Task reformulation: Concept learning problem (positive vs. negative examples of Target class)

Person	Age	Spect. presc.	Astigm.	Tear prod.	Lenses
01	young	myope	no	reduced	NO
02	young	myope	no	normal	YES
O3	young	myope	yes	reduced	NO
04	young	myope	yes	normal	YES
O5	young	hypermetrope	no	reduced	NO
06-013					
014	ore-presby	hypermetrope	no	normal	YES
O15	ore-presby	hypermetrope	yes	reduced	NO
O16	ore-presby	hypermetrope	yes	normal	NO
017	presbyopic	myope	no	reduced	NO
O18	presbyopic	myope	no	normal	NO
019-023					
024	presbyopic	hypermetrope	yes	normal	NO

# Illustrative example: Customer data

Customer	Gender	Age	Income	Spent	BigSpender
c1	male	30	214000	18800	yes
c2	female	19	139000	15100	yes
c3	male	55	50000	12400	no
c4	female	48	26000	8600	no
c5	male	63	191000	28100	yes
O6-O13					
c14	female	61	95000	18100	yes
c15	male	56	44000	12000	no
c16	male	36	102000	13800	no
c17	female	57	215000	29300	yes
c18	male	33	67000	9700	no
c19	female	26	95000	11000	no
c20	female	55	214000	28800	yes

### **Customer data: Decision trees**

# **Customer data: Association rules**

Type of task: description (pattern discovery)

Hypothesis language: rules X → Y, if X then Y

X, Y conjunctions of items (binary-valued attributes)

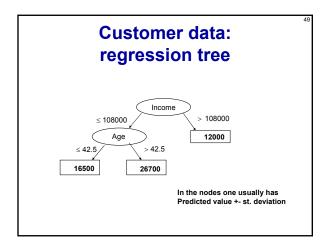

- 1. Age > 52 & BigSpender = no → Sex = male
- 2. Age > 52 & BigSpender = no  $\rightarrow$

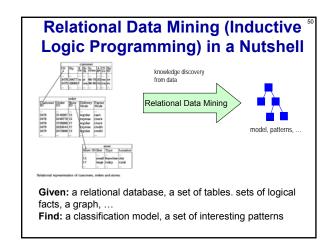

Sex = male & Income ≤ 73250

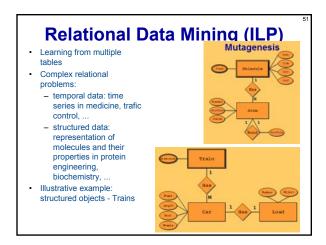

3. Sex = male & Age > 52 & Income ≤ 73250 → BigSpender = no

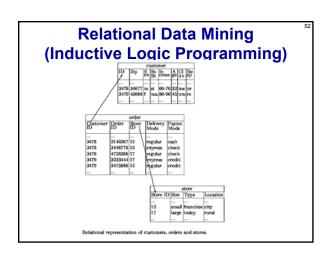

### **Predictive DM - Estimation**

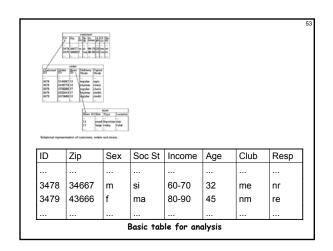

- · often referred to as regression
- data are objects, characterized with attributes (discrete or continuous), classes of objects are continuous (numeric)
- given objects described with attribute values, induce a model to predict the numeric class value
- regression trees, linear and logistic regression, ANN, kNN, ...

ID	Zip	Sex	Soc St	Income	Age	Club	Resp

### **Relational Data Mining** (Inductive Logic Programming)

### Data bases:

- Name of relation p
- Attribute of p
- n-tuple  $\langle v_1, ..., v_n \rangle$  = row in Ground fact  $p(v_1, ..., v_n)$ a relational table
- relation p = set of n-tuples = relational table

### Logic programming:

- · Predicate symbol p
- · Argument of predicate p
- · Definition of predicate p
  - Set of ground facts
  - Prolog clause or a set of Prolog

### Example predicate definition:

good customer(C) :customer(C,\_,female,\_,\_,\_,), order(C,\_,\_,creditcard).

### **Part I: Summary**

- KDD is the overall process of discovering useful knowledge in data
  - many steps including data preparation, cleaning, transformation, pre-processing
- · Data Mining is the data analysis phase in KDD
  - DM takes only 15%-25% of the effort of the overall KDD
  - employing techniques from machine learning and statistics
- · Predictive and descriptive induction have different goals: classifier vs. pattern discovery
- · Many application areas
- · Many powerful tools available

### Part II. Predictive DM techniques

- → Naive Bayesian classifier
  - Decision tree learning
  - · Classification rule learning
  - · Classifier evaluation

### **Bayesian methods**

- Bayesian methods simple but powerful classification methods
  - Based on Bayesian formula

$$p(H \mid D) = \frac{p(D \mid H)}{p(D)} p(H)$$

- · Main methods:
  - Naive Bayesian classifier
  - Semi-naïve Bayesian classifier
  - Bayesian networks \*
    - \* Out of scope of this course

### Naïve Bayesian classifier

• Probability of class, for given attribute values

$$p(c_j | v_1...v_n) = p(c_j) \cdot \frac{p(v_1...v_n | c_j)}{p(v_1...v_n)}$$

For all C<sub>i</sub> compute probability p(C<sub>i</sub>), given values v<sub>i</sub> of all attributes describing the example which we want to classify (assumption: conditional independence of attributes, when estimating  $p(C_i)$  and  $p(C_i|v_i)$ 

$$p(c_{j} | v_{1}...v_{n}) \approx p(c_{j}) \cdot \prod_{i} \frac{p(c_{j} | v_{i})}{p(c_{j})}$$

Output C<sub>MAX</sub> with maximal posterior probability of class:

$$C_{\text{MAX}} = \arg\max_{c_j} p(c_j | v_1...v_n)$$

### Naïve Bayesian classifier

$$\begin{split} & p(c_{j} \mid v_{1}...v_{n}) = \frac{p(c_{j} \cdot v_{1}...v_{n})}{p(v_{1}...v_{n})} = \frac{p(v_{1}...v_{n} \mid c_{j}) \cdot p(c_{j})}{p(v_{1}...v_{n})} = \\ & = \frac{\prod_{i} p(v_{i} \mid c_{j}) \cdot p(c_{i})}{p(v_{1}...v_{n})} = \frac{p(c_{j})}{p(v_{1}...v_{n})} \prod_{i} \frac{p(c_{j} \mid v_{i}) \cdot p(v_{i})}{p(c_{j})} = \\ & = p(c_{j}) \cdot \frac{\prod_{j} p(v_{i})}{p(v_{1}...v_{n})} \prod_{i} \frac{p(c_{j} \mid v_{i})}{p(c_{j})} \approx p(c_{j}) \cdot \prod_{i} \frac{p(c_{j} \mid v_{i})}{p(c_{j})} \end{split}$$

### Semi-naïve Bayesian classifier

Naive Bayesian estimation of probabilities (reliable)

 $\frac{p(c_j | v_i)}{p(c_i)} \cdot \frac{p(c_j | v_k)}{p(c_i)}$ 

Semi-naïve Bayesian estimation of probabilities (less reliable)

$$\frac{p(c_j | v_i, v_k)}{p(c_j)}$$

### **Probability estimation**

· Relative frequency:

$$p(c_j) = \frac{n(c_j)}{N}, p(c_j \mid v_i) = \frac{n(c_j, v_i)}{n(v_i)}$$
 j = 1. . k, for k classes

· Prior probability: Laplace law

$$p(c_j) = \frac{n(c_j) + 1}{N + k}$$

· m-estimate:

$$p(c_j) = \frac{n(c_j) + m \cdot p_a(c_j)}{N + m}$$

### **Probability estimation: intuition**

- · Experiment with N trials, n successful
- · Estimate probability of success of next trial
- · Relative frequency: n/N
  - reliable estimate when number of trials is large
  - Unreliable when number of trials is small, e.g., 1/1=1
- Laplace: (n+1)/(N+2), (n+1)/(N+k), k classes
  - Assumes uniform distribution of classes
- m-estimate: (n+m.pa)/(N+m)
  - Prior probability of success p<sub>a</sub>, parameter m (weight of prior probability, i.e., number of 'virtual' examples)

# Explanation of Bayesian classifier

- · Based on information theory
  - Expected number of bits needed to encode a message = optimal code length -log p for a message, whose probability is p (\*)
- Explanation based of the sum of information gains of individual attribute values V<sub>i</sub> (Kononenko and Bratko 1991, Kononenko 1993)

$$\begin{aligned} &-\log(p(c_j\mid v_1...v_n)) = \\ &= -\log(p(c_j)) - \sum_{i=1}^n (-\log p(c_j) + \log(p(c_j\mid v_i)) \end{aligned}$$

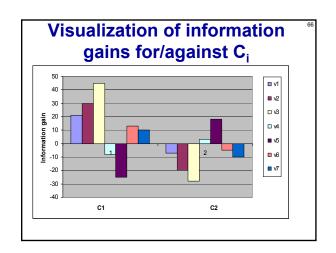

\* log p denotes binary logarithm

# Example of explanation of semi-naïve Bayesian classifier

Hip surgery prognosis

Class = no ("no complications", most probable class, 2 class problem)

Attribute value	For decision	Against
	(bit)	(bit)
Age = 70-80	0.07	
Sex = Female		-0.19
Mobility before injury = Fully mobile	0.04	
State of health before injury = Other	0.52	
Mechanism of injury = Simple fall		-0.08
Additional injuries = None	0	
Time between injury and operation > 10 days	0.42	
Fracture classification acc. To Garden = Garden III		-0.3
Fracture classification acc. To Pauwels = Pauwels III		-0.14
Transfusion = Yes	0.07	
Antibiotic profilaxies = Yes		-0.32
Hospital rehabilitation = Yes	0.05	
General complications = None		0
Combination:	0.21	
Time between injury and examination < 6 hours		
AND Hospitalization time between 4 and 5 weeks		
Combination:	0.63	
Therapy = Artroplastic AND anticoagulant therapy = Yes		

### Naïve Bayesian classifier

- · Naïve Bayesian classifier can be used
  - when we have sufficient number of training examples for reliable probability estimation
- It achieves good classification accuracy
  - can be used as 'gold standard' for comparison with other classifiers
- · Resistant to noise (errors)
  - Reliable probability estimation
  - Uses all available information
- · Successful in many application domains
  - Web page and document classification
  - Medical diagnosis and prognosis, ...

## Improved classification accuracy due to using m-estimate

### Appropriate problems for decision tree learning

- Classification problems: classify an instance into one of a discrete set of possible categories (medical diagnosis, classifying loan applicants, ...)
- · Characteristics:
  - instances described by attribute-value pairs (discrete or real-valued attributes)
  - target function has discrete output values (boolean or multi-valued, if real-valued then regression trees)
  - disjunctive hypothesis may be required
  - training data may be noisy (classification errors and/or errors in attribute values)
  - training data may contain missing attribute values

### Learning of decision trees

- ID3 (Quinlan 1979), CART (Breiman et al. 1984), C4.5, WEKA. ...
  - create the root node of the tree
  - if all examples from S belong to the same class Ci
    - then label the root with Ci
  - else
    - select the 'most informative' attribute A with values v1, v2, ... vn
    - divide training set S into S1,..., Sn according to values v1,...,vn
    - recursively build sub-trees T1,...,Tn for S1,...,Sn

### Search heuristics in ID3

- Central choice in ID3: Which attribute to test at each node in the tree? The attribute that is most useful for classifying examples.
- Define a statistical property, called information gain, measuring how well a given attribute separates the training examples w.r.t their target classification.
- First define a measure commonly used in information theory, called **entropy**, to characterize the (im)purity of an arbitrary collection of examples.

### **Entropy**

- S training set, C<sub>1</sub>,...,C<sub>N</sub> classes
- Entropy E(S) measure of the impurity of training set S

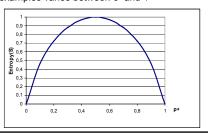

$$E\left(S\right)\!=\!-\sum_{c=1}^{N}p_{c}.\!\log_{\ 2}p_{c}\qquad \begin{array}{c} \mathbf{p_{c}}\text{-prior probability of class }\mathbf{C_{c}}\\ \text{(relative frequency of }\mathbf{C_{c}}\text{ in S)} \end{array}$$

· Entropy in binary classification problems

$$E(S) = -p_+ \log_2 p_+ - p_- \log_2 p_-$$

### **Entropy**

- $E(S) = -p_{+} \log_{2} p_{+} p_{-} \log_{2} p_{-}$
- The entropy function relative to a Boolean classification, as the proportion p<sub>+</sub> of positive examples varies between 0 and 1

### Entropy - why?

- Entropy E(S) = expected amount of information (in bits) needed to assign a class to a randomly drawn object in S (under the optimal, shortest-length code)
- Why?
- · Information theory: optimal length code assigns
  - log<sub>2</sub>p bits to a message having probability p
- So, in binary classification problems, the expected number of bits to encode + or – of a random member of S is:

$$p_{+}(-\log_{2}p_{+}) + p_{-}(-\log_{2}p_{-}) = -p_{+}\log_{2}p_{+} - p_{-}\log_{2}p_{-}$$

### PlayTennis: Entropy

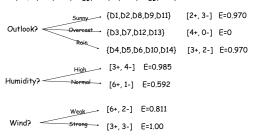

- Training set S: 14 examples (9 pos., 5 neg.)
- Notation: S = [9+, 5-]
- $E(S) = -p_{+} \log_{2} p_{+} p_{-} \log_{2} p_{-}$
- Computing entropy, if probability is estimated by relative frequency

$$E(S) = -\left(\frac{|S_+|}{|S|} \cdot \log \frac{|S_+|}{|S|}\right) - \left(\frac{|S_-|}{|S|} \cdot \log \frac{|S_-|}{|S|}\right)$$

•  $E([9+,5-]) = -(9/14) \log_2(9/14) - (5/14) \log_2(5/14)$ = 0.940 П

### PlayTennis: Entropy

- E(S) = p, log2p, p log2p
- $E(9+,5-) = -(9/14) \log_2(9/14) (5/14) \log_2(5/14) = 0.940$

# Information gain search heuristic

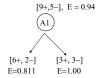

- Information gain measure is aimed to minimize the number of tests needed for the classification of a new object
- Gain(S,A) expected reduction in entropy of S due to sorting on A

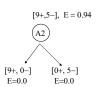

$$Gain(S, A) = E(S) - \sum_{v \in Values(A)} \frac{|S_v|}{|S|} \cdot E(S_v)$$

· Most informative attribute: max Gain(S,A)

# Information gain search heuristic

Which attribute is more informative, A1 or A2?

- $Gain(S,A1) = 0.94 (8/14 \times 0.811 + 6/14 \times 1.00) = 0.048$
- Gain(S,A2) = 0.94 0 = 0.94

A2 has max Gain

### PlayTennis: Information gain

$$Gain(S, A) = E(S) - \sum_{v \in Values(A)} \frac{|S_v|}{|S|} \cdot E(S_v)$$

Values(Wind) = {Weak, Strong}

- S = [9+,5-], E(S) = 0.940
- $S_{\text{weak}} = [6+,2-], E(S_{\text{weak}}) = 0.811$
- $-S_{strong} = [3+,3-], E(S_{strong}) = 1.0$
- Gain(S,Wind) = E(S) (8/14) $E(S_{weak})$  (6/14) $E(S_{strong})$  = 0.940 (8/14) $\times$ 0.811 (6/14) $\times$ 1.0=0.048

### PlayTennis: Information gain

- · Which attribute is the best?
  - Gain(S,Outlook)=0.246 MAX
  - Gain(S,Humidity)=0.151
  - Gain(S,Wind)=0.048
  - Gain(S,Temperature)=0.029

### PlayTennis: Information gain

- Which attribute should be tested here?
  - Gain( $S_{sunny}$ , Humidity) = 0.97-(3/5)0-(2/5)0 = 0.970 **MAX** !
  - $Gain(S_{sunny}, Temperature) = 0.97-(2/5)0-(2/5)1-(1/5)0 = 0.570$
  - $Gain(S_{sunny}, Wind) = 0.97-(2/5)1-(3/5)0.918 = 0.019$

### **Probability estimates**

Relative frequency :

- problems with small samples

 $p(Class|Cond) = \frac{n(Class.Cond)}{n(Cond)}$ 

[6+,1-](7) = 6/7[2+,0-](2) = 2/2 = 1

· Laplace estimate :

 assumes uniform prior distribution of k classes

$$= \frac{n(Class.Cond) + 1}{n(Cond) + k} \quad k = 2$$

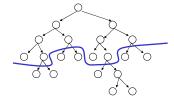

$$[6+,1-](7) = 6+1 / 7+2 = 7/9$$
  
 $[2+,0-](2) = 2+1 / 2+2 = 3/4$ 

### **Heuristic search in ID3**

- Search bias: Search the space of decision trees from simplest to increasingly complex (greedy search, no backtracking, prefer small trees)
- Search heuristics: At a node, select the attribute that is most useful for classifying examples, split the node accordingly
- Stopping criteria: A node becomes a leaf
  - if all examples belong to same class  $\boldsymbol{C}_j,$  label the leaf with  $\boldsymbol{C}_i$
  - if all attributes were used, label the leaf with the most common value  $C_{\rm k}$  of examples in the node
- · Extension to ID3: handling noise tree pruning

### **Pruning of decision trees**

- · Avoid overfitting the data by tree pruning
- · Pruned trees are
  - less accurate on training data
  - more accurate when classifying unseen data

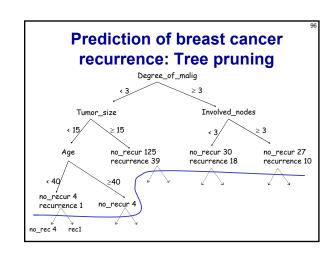

### Handling noise - Tree pruning

Sources of imperfection

- 1. Random errors (noise) in training examples
  - · erroneous attribute values
  - · erroneous classification
- 2. Too sparse training examples (incompleteness)
- 3. Inappropriate/insufficient set of attributes (inexactness)
- 4. Missing attribute values in training examples

### Handling noise - Tree pruning

- · Handling imperfect data
  - handling imperfections of type 1-3
    - pre-pruning (stopping criteria)
    - post-pruning / rule truncation
  - handling missing values
- Pruning avoids perfectly fitting noisy data: relaxing the completeness (fitting all +) and consistency (fitting all -) criteria in ID3

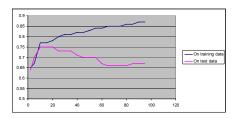

### **Accuracy and error**

- · Accuracy: percentage of correct classifications
  - on the training set
  - on unseen instances
- How accurate is a decision tree when classifying unseen instances
  - An estimate of accuracy on unseen instances can be computed, e.g., by averaging over 4 runs:
    - split the example set into training set (e.g. 70%) and test set (e.g. 30%)
    - · induce a decision tree from training set, compute its accuracy on test
- Error = 1 Accuracy
- · High error may indicate data overfitting

### Overfitting and accuracy

· Typical relation between tree size and accuracy

· Question: how to prune optimally?

### **Avoiding overfitting**

- · How can we avoid overfitting?
  - Pre-pruning (forward pruning): stop growing the tree e.g., when data split not statistically significant or too few examples are in a split
  - Post-pruning: grow full tree, then post-prune

- forward pruning considered inferior (myopic)
- post pruning makes use of sub trees

### How to select the "best" tree

- · Measure performance over training data (e.g., pessimistic post-pruning, Quinlan 1993)
- Measure performance over separate validation data set (e.g., reduced error pruning, Quinlan 1987)
  - until further pruning is harmful DO:
    - for each node evaluate the impact of replacing a subtree by a leaf, assigning the majority class of examples in the leaf, if the pruned tree performs no worse than the original over the validation set
    - greedily select the node whose removal most improves tree accuracy over the validation set
- MDL: minimize size(tree)+size(misclassifications(tree))

### Selected decision/regression tree learners

- · Decision tree learners
  - ID3 (Quinlan 1979)
  - CART (Breiman et al. 1984)
  - Assistant (Cestnik et al. 1987)
  - C4.5 (Quinlan 1993), C5 (See5, Quinlan)
  - J48 (available in WEKA)
- · Regression tree learners, model tree learners
  - M5, M5P (implemented in WEKA)

### Features of C4.5

- · Implemented as part of the WEKA data mining workbench
- · Handling noisy data: post-pruning
- Handling incompletely specified training instances: 'unknown' values (?)
  - in learning assign conditional probability of value v: p(v|C) = p(vC) / p(C)
  - in classification: follow all branches, weighted by prior prob. of missing attribute values

Other features of C4.5

- · Binarization of attribute values
  - for continuous values select a boundary value maximally increasing the informativity of the attribute: sort the values and try every possible split (done automaticaly)
  - for discrete values try grouping the values until two groups remain \*
- 'Majority' classification in NULL leaf (with no corresponding training example)
  - if an example 'falls' into a NULL leaf during classification, the class assigned to this example is the majority class of the parent of the NULL leaf

 $^{igstar}$  the basic C4.5 doesn't support binarisation of discrete attributes, it supports grouping

### Part II. Predictive DM techniques

- Naïve Bayesian classifier
- · Decision tree learning
- Classification rule learning
  - Classifier evaluation

Rule Learning in a Nutshell

Given: transaction data table, relational database (a set of objects, described by attribute values)

Find: a classification model in the form of a set of rules; or a set of interesting patterns in the form of individual

### Rule set representation

- · Rule base is a disjunctive set of conjunctive rules
- · Standard form of rules:

IF Condition THEN Class

Class IF Conditions

Class ← Conditions

**IF** Outlook=Sunny ∧ Humidity=Normal **THEN**PlayTennis=Yes

IF Outlook=Overcast THEN PlayTennis=Yes

 $\textbf{IF} \ \mathsf{Outlook} \texttt{=} \mathsf{Rain} \land \mathsf{Wind} \texttt{=} \mathsf{Weak} \ \textbf{THEN} \ \mathsf{PlayTennis} \texttt{=} \mathsf{Yes}$ 

· Form of CN2 rules:

IF Conditions THEN MajClass [ClassDistr]

• Rule base: {R1, R2, R3, ..., DefaultRule}

### Data mining example Input: Contact lens data

Person	Age	Spect. presc.	Astigm.	Tear prod.	Lenses
01	young	myope	no	reduced	NONE
02	young	myope	no	normal	SOFT
O3	young	myope	yes	reduced	NONE
04	young	myope	yes	normal	HARD
O5	young	hypermetrope	no	reduced	NONE
O6-O13					
014	ore-presbyo	hypermetrope	no	normal	SOFT
O15	ore-presbyo	hypermetrope	yes	reduced	NONE
O16	ore-presbyo	hypermetrope	yes	normal	NONE
O17	presbyopic	myope	no	reduced	NONE
O18	presbyopic	myope	no	normal	NONE
O19-O23					
O24	presbyopic	hypermetrope	yes	normal	NONE

# Contact lens data: Classification rules

Type of task: prediction and classification

Hypothesis language: rules X → C, if X then C

X conjunction of attribute values, C class

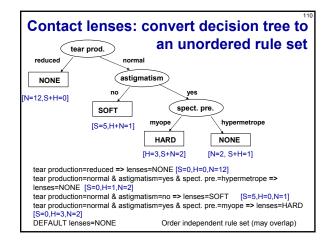

tear production=reduced → lenses=NONE
tear production=normal & astigmatism=yes &
 spect. pre.=hypermetrope → lenses=NONE
tear production=normal & astigmatism=no →
lenses=SOFT

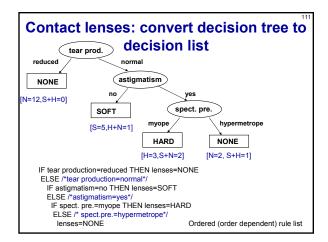

tear production=normal & astigmatism=yes & spect. pre.=myope → lenses=HARD DEFAULT lenses=NONE

. . . .

### **Rule learning**

- · Two rule learning approaches:
  - Learn decision tree, convert to rules
  - Learn set/list of rules
    - · Learning an unordered set of rules
    - · Learning an ordered list of rules
- · Heuristics, overfitting, pruning

## Converting decision tree to rules, and rule post-pruning (Quinlan 1993)

- Very frequently used method, e.g., in C4.5 and J48
- · Procedure:
  - grow a full tree (allowing overfitting)
  - convert the tree to an equivalent set of rules
  - prune each rule independently of others
  - sort final rules into a desired sequence for use

# Concept learning: Task reformulation for rule learning: (pos. vs. neg. examples of Target class)

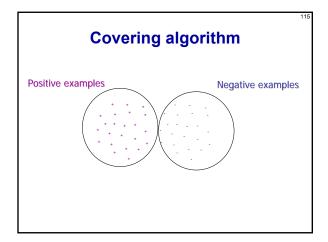

Person	Age	Spect. presc.	Astigm.	Tear prod.	Lenses
01	young	myope	no	reduced	NO
02	young	myope	no	normal	YES
O3	young	myope	yes	reduced	NO
04	young	myope	yes	normal	YES
O5	young	hypermetrope	no	reduced	NO
O6-O13

O15	ore-presbyo	hypermetrope	yes	reduced	NO
O16	ore-presbyo	hypermetrope	yes	normal	NO
017	presbyopic	myope	no	reduced	NO
O18	presbyopic	myope	no	normal	NO
019-023					
024	presbyopic	hypermetrope	yes	normal	NO

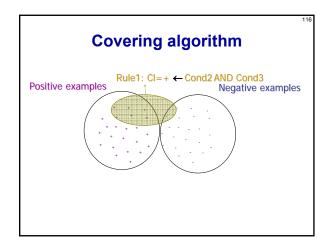

# Original covering algorithm (AQ, Michalski 1969,86)

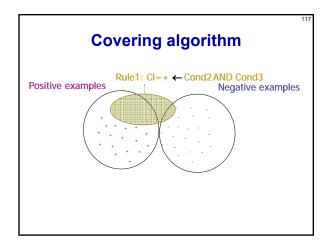

Given examples of N classes  $C_1, ..., C_N$  for each class  $C_1$  do

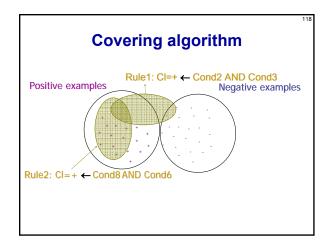

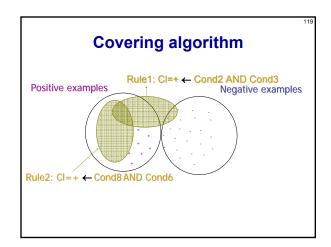

- Dula Da a (Ci) a grante
- RuleBase(Ci) := empty
- repeat {learn-set-of-rules}
   learn-one-rule R covering some positive
  - examples and no negatives
    add R to RuleBase(Ci)
  - · delete from Pi all pos. ex. covered by R
- until Pi = empty

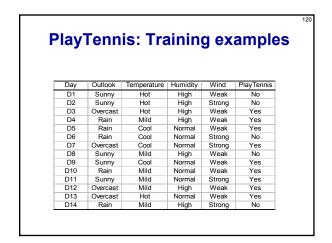

# Heuristics for learn-one-rule: PlayTennis example PlayTennis = yes [9+,5-] (14) PlayTennis = yes Wind=weak [6+,2-] (8) Wind=strong [3+,3-] (6) Humidity=normal [6+,1-] (7) Humidity=normal [6+,1-] (2) Luttook=sunny [2+,0-] (2) Estimating rule accuracy (rule precision) with the probability that a covered example is positive A(Class Cond) = p(Class| Cond) Estimating the probability with the relative frequency of covered pos. ex. / all covered ex. [6+,1-] (7) = 6/7, [2+,0-] (2) = 2/2 = 1

```
Probability estimates

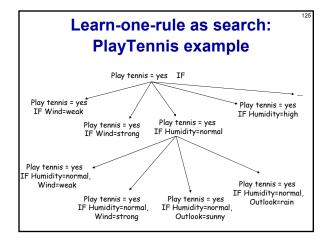

• Relative frequency:
    - problems with small samples
= \frac{n(Class.Cond)}{n(Cond)}
= \frac{n(Class.Cond)}{n(Cond)}
• Laplace estimate:
    - assumes uniform prior distribution of k classes
= \frac{n(Class.Cond) + 1}{n(Cond) + k} \quad k = 2
= \frac{n(Class.Cond) + 1}{n(Cond) + k} \quad k = 2
```

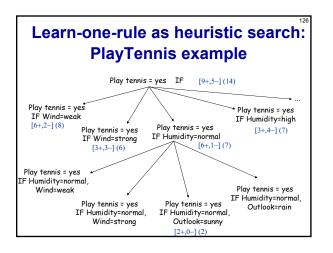

## Learn-one-rule: search heuristics

- Assume a two-class problem
- Two classes (+,-), learn rules for + class (CI).
- Search for specializations R' of a rule R = Cl ← Cond from the RuleBase.
- Specializarion R' of rule R = CI ← Cond
   has the form R' = CI ← Cond & Cond'
- Heuristic search for rules: find the 'best' Cond' to be added to the current rule R, such that rule accuracy is improved, e.g., such that Acc(R') > Acc(R)
  - where the expected classification accuracy can be estimated as A(R) = p(Cl|Cond)

### Learn-one-rule: Greedy vs. beam search

- learn-one-rule by greedy general-to-specific search, at each step selecting the `best' descendant, no backtracking
  - e.g., the best descendant of the initial rule PlayTennis = yes  $\leftarrow$
  - is rule PlayTennis = yes ← Humidity=normal
- beam search: maintain a list of k best candidates at each step; descendants (specializations) of each of these k candidates are generated, and the resulting set is again reduced to k best candidates

### What is "high" rule accuracy (rule precision)?

- Rule evaluation measures:
  - aimed at maximizing classification accuracy
  - minimizing Error = 1 Accuracy
  - avoiding overfitting
- BUT: Rule accuracy/precision should be traded off against the "default" accuracy/precision of the rule CI ←true
  - 68% accuracy is OK if there are 20% examples of that class in the training set, but bad if there are 80%
- Relative accuracy
  - $-RAcc(CI \leftarrow Cond) = p(CI \mid Cond) p(CI)$

### Weighted relative accuracy

- If a rule covers a single example, its accuracy/precision is either 0% or 100%
  - maximising relative accuracy tends to produce many overly specific rules
- Weighted relative accuracy  $WRAcc(Cl \leftarrow Cond) = p(Cond) \cdot [p(Cl \mid Cond) - p(Cl)]$
- · WRAcc is a fundamental rule evaluation measure:
  - WRAcc can be used if you want to assess both accuracy and
  - WRAcc can be used if you want to compare rules with different heads and bodies

### Learn-one-rule: search heuristics

- Assume two classes (+.-), learn rules for + class (CI), Search for specializations of one rule  $R = CI \leftarrow Cond$  from RuleBase.
- Expected classification accuracy: A(R) = p(CI|Cond)
- Informativity (info needed to specify that example covered by Cond belongs to CI):  $I(R) = -log_2p(CI|Cond)$
- Accuracy gain (increase in expected accuracy): AG(R',R) = p(CI|Cond') - p(CI|Cond)
- Information gain (decrease in the information needed):  $IG(R',R) = log_2p(CI|Cond') - log_2p(CI|Cond)$
- Weighted measures favoring more general rules: WAG, WIG WAG(R',R) =

p(Cond')/p(Cond). (p(CI|Cond') - p(CI|Cond))

Weighted relative accuracy trades off coverage and relative accuracy WRAcc(R) =  $p(Cond) \cdot (p(CI|Cond) - p(CI))$ 

### Ordered set of rules: if-then-else rules

- · rule Class IF Conditions is learned by first determining Conditions and then Class
- Notice: mixed sequence of classes C1, ..., Cn in RuleBase
- But: ordered execution when classifying a new instance: rules are sequentially tried and the first rule that 'fires' (covers the example) is used for
- Decision list {R1, R2, R3, ..., D}: rules Ri are interpreted as if-then-else rules
- If no rule fires, then DefaultClass (majority class in  $E_{cur}$ )

### Sequential covering algorithm (similar as in Mitchell's book)

- · RuleBase := empty
- E<sub>cur</sub>:= E
- repeat
  - learn-one-rule R
  - RuleBase := RuleBase U R
  - $-E_{cur} := E_{cur} \{examples covered and correctly classified by R\}$  (DELETE ONLY POS. EX.!)
  - until performance(R, E<sub>cur</sub>) < ThresholdR</p>
- RuleBase := sort RuleBase by performance(R,E)
- · return RuleBase

### Learn ordered set of rules (CN2, Clark and Niblett 1989)

- · RuleBase := empty
- E<sub>cur</sub>:= E
- repeat
  - learn-one-rule R
  - RuleBase := RuleBase U R
  - $-E_{cur} := E_{cur} \{all examples covered by R\}$ (NOT ONLY POS. EX.!)
- until performance(R, E<sub>cur</sub>) < ThresholdR
- RuleBase := sort RuleBase by performance(R,E)
- RuleBase := RuleBase U DefaultRule(E<sub>cur</sub>)

### Learn-one-rule: Beam search in CN2

- Beam search in CN2 learn-one-rule algo.:
  - construct BeamSize of best rule bodies (conjunctive conditions) that are statistically significant
  - BestBody min. entropy of examples covered by Body
  - construct best rule R := Head ← BestBody by adding majority class of examples covered by BestBody in rule Head
- performance (R, E<sub>cur</sub>) : Entropy(E<sub>cur</sub>)
  - performance(R, E<sub>cur</sub>) < ThresholdR (neg. num.)</li>
  - Why? Ent. > t is bad, Perf. = -Ent < -t is bad

### **Variations**

- · Sequential vs. simultaneous covering of data (as in TDIDT): choosing between attribute-values vs. choosing attributes
- · Learning rules vs. learning decision trees and converting them to rules
- · Pre-pruning vs. post-pruning of rules
- · What statistical evaluation functions to use
- · Probabilistic classification

### Probabilistic classification

- In the ordered case of standard CN2 rules are interpreted in an IFTHEN-ELSE fashion, and the first fired rule assigns the class.
- In the unordered case all rules are tried and all rules which fire are collected. If a clash occurs, a probabilistic method is used to resolve the
- A simplified example:
  - 1. tear production=reduced => lenses=NONE [S=0,H=0,N=12]
  - tear production=normal & astigmatism=yes & spect. pre.=hypermetrope => lenses=NONE [S=0,H=1,N=2]
  - 3. tear production=normal & astigmatism=no => lenses=SOFT [S=5,H=0,N=1]
  - 4. tear production=normal & astigmatism=yes & spect. pre.=myope => lenses=HARD [S=0,H=3,N=2]
  - 5. DEFAULT lenses=NONE

Suppose we want to classify a person with normal tear production and astigmatism. Two rules fire: rule 2 with coverage [S=0,H=1,N=2] and rule 4 with coverage [S=0,H=3,N=2]. The classifier computes total coverage as [S=0,H=4,N=4], resulting in probabilistic classification into class H with probability 0.5 and N with probability 0.5. In this case, the clash can not be resolved, as both probabilities are equal.

### Part II. Predictive DM techniques

- Naïve Bayesian classifier
- · Decision tree learning
- · Classification rule learning
- Classifier evaluation

### Classifier evaluation

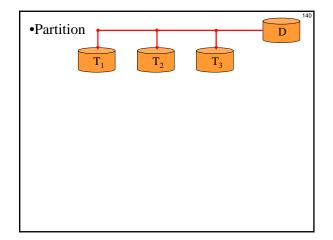

- · Accuracy and Error
- · n-fold cross-validation
- · Confusion matrix
- ROC

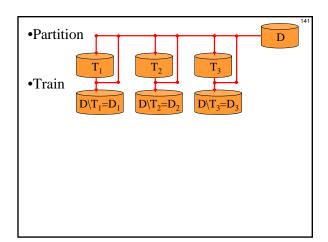

### **Evaluating hypotheses**

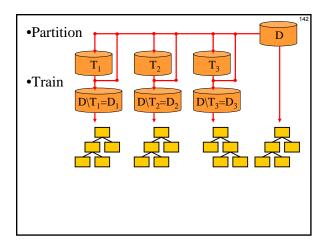

- · Use of induced hypotheses
  - discovery of new patterns, new knowledge
  - classification of new objects
- · Evaluating the quality of induced hypotheses
  - Accuracy, Error = 1 Accuracy
  - classification accuracy on testing examples = percentage of correctly classified instances
    - split the example set into training set (e.g. 70%) to induce a concept, and test set (e.g. 30%) to test its accuracy
    - more elaborate strategies: 10-fold cross validation, leave-one-out....
  - comprehensibility (compactness)
  - information contents (information score), significance

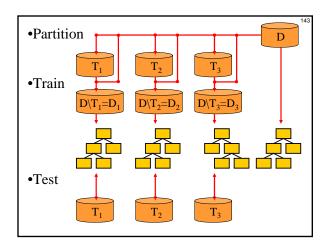

### n-fold cross validation

- · A method for accuracy estimation of classifiers
- Partition set D into n disjoint, almost equally-sized folds T<sub>i</sub> where U<sub>i</sub> T<sub>i</sub> = D
- for i = 1, ..., n do
  - form a training set out of n-1 folds: Di =  $D\T_i$
  - induce classifier H<sub>i</sub> from examples in Di
  - use fold T<sub>i</sub> for testing the accuracy of H<sub>i</sub>
- Estimate the accuracy of the classifier by averaging accuracies over 10 folds T<sub>i</sub>

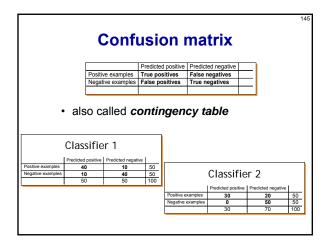

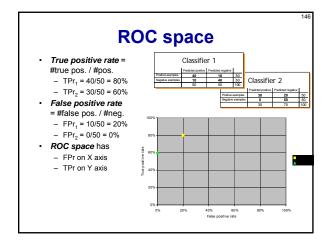

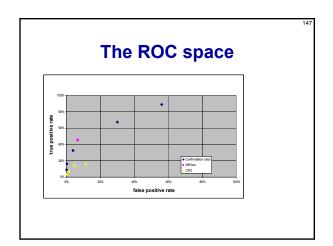

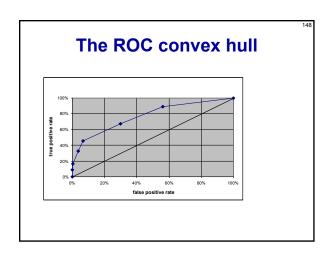

# Confusion matrix and rule (in)accuracy

- Accuracy of a classifier is measured as TP+TN / N.
- Suppose two rules are both 80% accurate on an evaluation dataset, are they always equally good?
  - e.g., Rule 1 correctly classifies 40 out of 50 positives and 40 out of 50 negatives; Rule 2 correctly classifies 30 out of 50 positives and 50 out of 50 negatives
  - on a test set which has more negatives than positives, Rule 2 is preferable;
  - on a test set which has more positives than negatives, Rule 1 is preferable; unless...
  - ...the proportion of positives becomes so high that the 'always positive' predictor becomes superior!
- Conclusion: classification accuracy is not always an appropriate rule quality measure

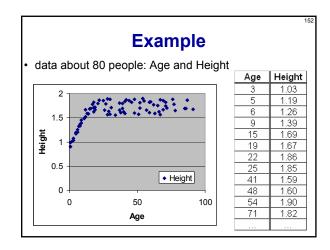

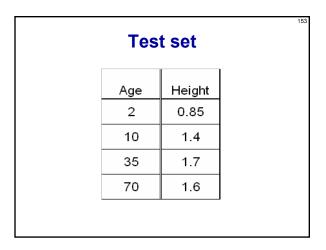

### **Summary of evaluation**

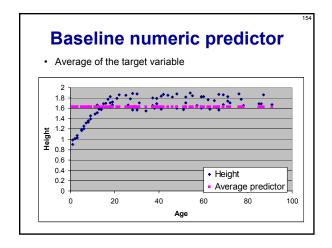

- 10-fold cross-validation is a standard classifier evaluation method used in machine learning
- ROC analysis is very natural for rule learning and subgroup discovery
  - can take costs into account
  - here used for evaluation
  - also possible to use as search heuristic

correlation coefficient	$\frac{S_{PA}}{\sqrt{S_P S_A}}$ , where $S_{PA} = \frac{\sum_i (\rho_i - \overline{\rho})(a_i - \overline{a})}{n-1}$ ,
	$S_p = \frac{\sum_i (p_i - \overline{p})^2}{n-1}$ , and $S_A = \frac{\sum_i (a_i - \overline{a})^2}{n-1}$

### Part IV. Descriptive DM techniques

- Predictive vs. descriptive induction
  - Subgroup discovery
  - · Association rule learning
  - · Hierarchical clustering

### Predictive vs. descriptive induction

- Predictive induction: Inducing classifiers for solving classification and prediction tasks,
  - Classification rule learning, Decision tree learning, ...
  - Bayesian classifier, ANN, SVM, ...
  - Data analysis through hypothesis generation and testing
- **Descriptive induction:** Discovering interesting regularities in the data, uncovering patterns, ... for solving KDD tasks
  - Symbolic clustering, Association rule learning, Subgroup discovery, ...
  - Exploratory data analysis

### **Descriptive DM**

- · Often used for preliminary explanatory data analysis
- · User gets feel for the data and its structure
- Aims at deriving descriptions of characteristics of the data
- · Visualization and descriptive statistical techniques can be used

Descriptive DM

### Description

- Data description and summarization: describe elementary and aggregated data characteristics (statistics, ...)
- Dependency analysis:
  - · describe associations, dependencies, ...
  - · discovery of properties and constraints

### Segmentation

- Clustering: separate objects into subsets according to distance and/or similarity (clustering, SOM, visualization, ...)
- Subgroup discovery: find unusual subgroups that are significantly different from the majority (deviation detection w.r.t. overall class distribution)

### Predictive vs. descriptive induction: A rule learning perspective

- Predictive induction: Induces rulesets acting as classifiers for solving classification and prediction
- Descriptive induction: Discovers individual rules describing interesting regularities in the data
- Therefore: Different goals, different heuristics, different evaluation criteria

Supervised vs. unsupervised learning: A rule learning perspective

- Supervised learning: Rules are induced from labeled instances (training examples with class assignment) - usually used in predictive induction
- Unsupervised learning: Rules are induced from unlabeled instances (training examples with no class assignment) - usually used in descriptive induction
- **Exception: Subgroup discovery**

Discovers individual rules describing interesting regularities in the data from labeled examples

### Part IV. Descriptive DM techniques

Predictive vs. descriptive induction

Subgroup discovery

- · Association rule learning
- · Hierarchical clustering

**Subgroup Discovery** 

Given: a population of individuals and a target class label (the property of individuals we are interested in)

Find: population subgroups that are statistically most 'interesting', e.g., are as large as possible and have most unusual statistical (distributional) characteristics w.r.t. the target class (property of interest)

### **Subgroup interestingness**

### Interestingness criteria:

- As large as possible
- Class distribution as different as possible from the distribution in the entire data set
- Significant
- Surprising to the user
- Non-redundant
- Simple
- Useful actionable

**Subgroup Discovery: Medical Case Study** 

- Find and characterize population subgroups with high risk for coronary heart disease (CHD) (Gamberger, Lavrač, Krstačić)
- A1 for males: principal risk factors

CHD ← pos. fam. history & age > 46

A2 for females: principal risk factors CHD ← bodyMassIndex > 25 & age >63

- A1, A2 (anamnestic info only), B1, B2 (an. and physical examination), C1 (an., phy. and ECG)
- A1: supporting factors (found by statistical analysis): psychosocial stress, as well as cigarette smoking, hypertension and overweight

**Subgroup visualization** Subgroups of patients with CHD risk [Gamberger, Lavrač & Wettschereck, IDAMAP2002]

### Subgroups vs. classifiers

- - Classification rules aim at pure subgroups
  - A set of rules forms a domain model
- Subgroups:
  - Rules describing subgroups aim at significantly higher proportion of positives
- Each rule is an independent chunk of knowledge
- Link
  - SD can be viewed as cost-sensitive classification
  - Instead of FNcost we aim at increased TPprofit

### **Classification Rule Learning for Subgroup Discovery: Deficiencies**

- · Only first few rules induced by the covering algorithm have sufficient support (coverage)
- · Subsequent rules are induced from smaller and strongly biased example subsets (pos. examples not covered by previously induced rules), which hinders their ability to detect population subgroups
- · 'Ordered' rules are induced and interpreted sequentially as a if-then-else decision list

### **CN2-SD: Adapting CN2 Rule Learning to Subgroup Discovery**

- · Weighted covering algorithm
- · Weighted relative accuracy (WRAcc) search heuristics, with added example weights
- · Probabilistic classification
- · Evaluation with different interestingness measures

### CN2-SD: CN2 Adaptations

- · General-to-specific search (beam search) for best rules
- · Rule quality measure:
  - CN2: Laplace: Acc(Class ← Cond) = =  $p(Class|Cond) = (n_c+1)/(n_{rule}+k)$
  - CN2-SD: Weighted Relative Accuracy

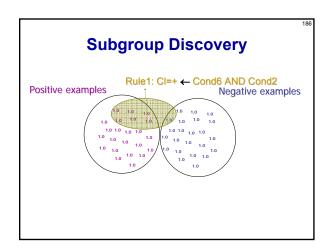

WRAcc(Class ← Cond) = p(Cond) (p(Class|Cond) - p(Class))

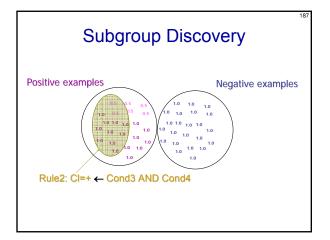

- · Weighted covering approach (example weights)
- · Significance testing (likelihood ratio statistics)
- · Output: Unordered rule sets (probabilistic classification)

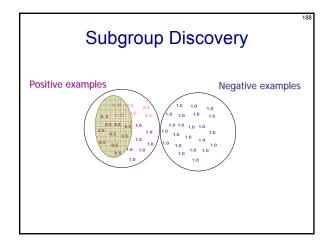

### **CN2-SD: Weighted Covering**

- · Standard covering approach: covered examples are deleted from current training set
- · Weighted covering approach:
  - weights assigned to examples
  - covered pos. examples are re-weighted: in all covering loop iterations, store count i how many times (with how many rules induced so far) a pos. example has been covered: w(e,i), w(e,0)=1
    - Additive weights: w(e,i) = 1/(i+1) w(e,i) - pos. example e being covered i times

# Subgroup Discovery Positive examples Negative examples

### **CN2-SD: Weighted WRAcc Search** Heuristic

· Weighted relative accuracy (WRAcc) search heuristics, with added example weights

WRAcc(CI  $\leftarrow$  Cond) = p(Cond) (p(CI|Cond) - p(CI)) increased coverage, decreased # of rules, approx. equal accuracy (PKDD-2000)

· In WRAcc computation, probabilities are estimated with relative frequencies, adapt:

 $WRAcc(CI \leftarrow Cond) = p(Cond) (p(CI|Cond) - p(CI)) =$ n'(Cond)/N' ( n'(Cl.Cond)/n'(Cond) - n'(Cl)/N' )

- N': sum of weights of examples
- n'(Cond): sum of weights of all covered examples
- n'(Cl.Cond): sum of weights of all correctly covered examples

### Part IV. Descriptive DM techniques

- Predictive vs. descriptive induction
- Subgroup discovery
- Association rule learning
  - · Hierarchical clustering

### **Association Rule Learning**

Rules: X =>Y, if X then Y

X and Y are itemsets (records, conjunction of items), where items/features are binary-valued attributes)

**Given:** Transactions itemsets (records) t2 0 0

Find: A set of association rules in the form X =>Y **Example:** Market basket analysis

beer & coke => peanuts & chips (0.05, 0.65)

- Support: Sup(X,Y) = #XY/#D = p(XY)
- Confidence: Conf(X,Y) = #XY/#X = Sup(X,Y)/Sup(X) = = p(XY)/p(X) = p(Y|X)

### **Association Rule Learning: Examples**

- · Market basket analysis
  - beer & coke ⇒ peanuts & chips (5%, 65%) (IF beer AND coke THEN peanuts AND chips)
  - Support 5%: 5% of all customers buy all four items
  - Confidence 65%: 65% of customers that buy beer and coke also buy peanuts and chips
- Insurance
  - mortgage & loans & savings ⇒ insurance (2%, 62%)
  - Support 2%: 2% of all customers have all four
  - Confidence 62%: 62% of all customers that have mortgage, loan and savings also have insurance

### Association rule learning

- X ⇒ Y . . . IF X THEN Y, where X and Y are itemsets
- · intuitive meaning: transactions that contain X tend to contain Y
- Items binary attributes (features) m,f,headache, muscle pain, arthrotic, arthritic, spondylotic, spondylitic, stiff\_less\_1\_hour
- · Example transactions itemsets formed of patient records

```
i1 i2 ..... i50
t1 1 0 0
t2 0 1 0
... ... ...
```

· Association rules

spondylitic  $\Rightarrow$  arthritic & stiff\_gt\_1\_hour [5%, 70%] arthrotic & spondylotic  $\Rightarrow$  stiff\_less\_1\_hour [20%, 90%]

### **Association Rule Learning**

Given: a set of transactions D

Find: all association rules that hold on the set of transactions that have

- user defined minimum support, i.e., support > MinSup, and
- user defined minimum confidence, i.e., confidence > MinConf

It is a form of exploratory data analysis, rather than hypothesis verification

### **Searching for the associations**

- · Find all large itemsets
- Use the large itemsets to generate association rules
- If XY is a large itemset, compute
   r =support(XY) / support(X)
- If r > MinConf, then X ⇒ Y holds (support > MinSup, as XY is large)

### Large itemsets

- Large itemsets are itemsets that appear in at least MinSup transaction
- All subsets of a large itemset are large itemsets (e.g., if A,B appears in at least MinSup transactions, so do A and B)
- This observation is the basis for very efficient algorithms for association rules discovery (linear in the number of transactions)

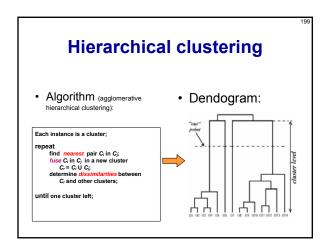

## Association vs. Classification rules rules

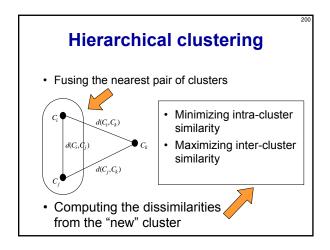

- Exploration of dependencies
- Different combinations of dependent and independent attributes
- Complete search (all rules found)
- · Focused prediction
- Predict one attribute (class) from the others
- Heuristic search (subset of rules found)

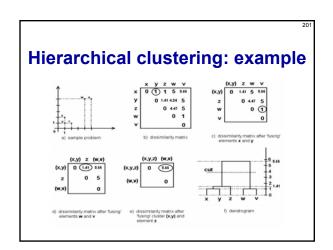

. . . . . . .

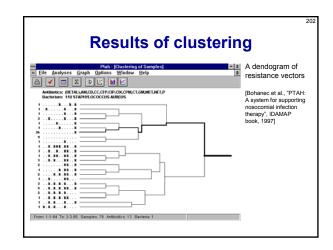

### Part IV. Descriptive DM techniques

- Predictive vs. descriptive induction
- Subgroup discovery
- Association rule learning
- Hierarchical clustering

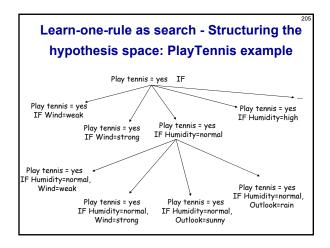

# Part V: Relational Data Mining

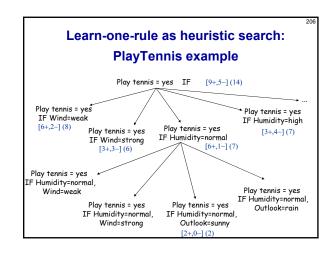

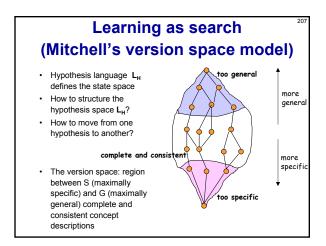

- · What is RDM?
- · Propositionalization techniques
- · Inductive Logic Programming

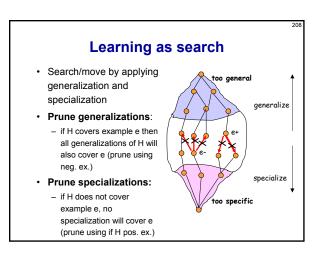

### Learning as search

- Structuring the state space: Representing a partial order of hypotheses (e.g. rules) as a graph
  - nodes: concept descriptions (hypotheses/rules)
  - arcs defined by specialization/generalization operators: an arc from parent to child exists ifand-only-if parent is a proper most specific generalization of child
- **Specialization operators**: e.g., adding conditions: s(A=a2 & B=b1) = {A=a2 & B=b1 & D=d1, A=a2 & B=b1 & D=d2}
- Generalization operators: e.g., dropping conditions: g(A=a2 & B=b1) = {A=a2, B=b1}
- Partial order of hypotheses defines a lattice (called a refinement graph)

### Learning as search: Learner's ingredients

- structure of the search space (specialization and generalization operators)
- search strategy
  - · depth-first
  - · breath-first
  - · heuristic search (best first, hill-climbing, beam search)
- search heuristics
  - · measure of attribute 'informativity'
  - measure of 'expected classification accuracy' (relative frequency, Laplace estimate, m-estimate), ...
- stopping criteria (consistency, completeness, statistical significance, ...)

## Learn-one-rule: search heuristics

Assume a two-class problem

- Two classes (+,-), learn rules for + class (CI).
- Search for specializations R' of a rule R = Cl ← Cond from the RuleBase.
- Specializarion R' of rule R = CI ← Cond

has the form R' = CI ← Cond & Cond'

- Heuristic search for rules: find the 'best' Cond' to be added to the current rule R, such that rule accuracy is improved, e.g., such that Acc(R') > Acc(R)
  - where the expected classification accuracy can be estimated as A(R) = p(CI|Cond)

### Learn-one-rule – Search strategy: Greedy vs. beam search

- learn-one-rule by greedy general-to-specific search, at each step selecting the `best' descendant, no backtracking
  - e.g., the best descendant of the initial rule PlayTennis = yes  $\leftarrow$
  - is rule PlayTennis = yes ← Humidity=normal
- beam search: maintain a list of k best candidates at each step; descendants (specializations) of each of these k candidates are generated, and the resulting set is again reduced to k best candidates

# Part V: Relational Data Mining

· Learning as search

What is RDM?

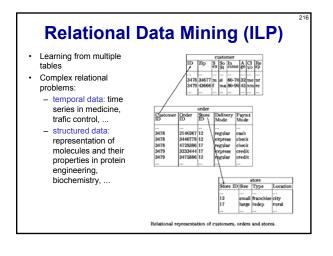

- · Propositionalization techniques
- · Inductive Logic Programming

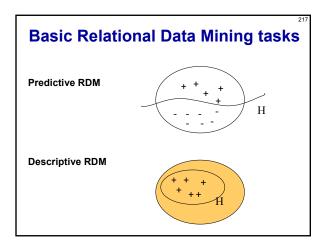

### **Predictive relational DM**

- · Data stored in relational databases
- · Single relation propositional DM
  - example is a tuple of values of a fixed number of attributes (one attribute is a class)
  - example set is a table (simple field values)
- Multiple relations relational DM (ILP)
  - example is a tuple or a set of tuples (logical fact or set of logical facts)
  - example set is a set of tables (simple or complex structured objects as field values)

# Data for propositional DM Sample single relation data table D Name First. Street City Zip Sex Social In Name House States Course States Cour

# Multi-relational data made propositional Sample relation table | 10 | 2/19 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 | 2/15 |

### **Predictive ILP**

- · Given:
  - A set of observations
    - positive examples E<sup>+</sup>
      negative examples E

  - background knowledge B - hypothesis language  $L_H$
  - covers relation

A hypothesis  $H \in L_{H}$ , such that (given B) H covers all positive and no negative examples

- In logic, find H such that

  - $\forall e \in E^+: B \land H |= e (H \text{ is complete})$   $\forall e \in E^-: B \land H |=/= e (H \text{ is consistent})$
- In ILP, *E* are ground facts, *B* and *H* are (sets of) definite clauses

### **Predictive ILP**

- Given:
  - A set of observations
    - positive examples E<sup>+</sup>
      negative examples E
  - background knowledge B
  - hypothesis language L<sub>H</sub>
  - covers relation
  - quality criterion

A hypothesis  $H \in L_H$ , such that (given B) H is optimal w.r.t. some quality criterion, e.g., max. predictive accuracy A(H)

(instead of finding a hypothesis  $H \in L_{H}$ , such that (given B) H covers all positive and no negative examples)

### **Descriptive ILP**

- Given:
  - A set of observations
  - (positive examples E+)
  - background knowledge B
  - hypothesis language  $L_H$
  - covers relation

Maximally specific hypothesis  $H \in L_{H}$ , such that (given B) H covers all positive examples

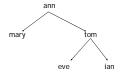

- In logic, **find** H such that  $\forall c \in H$ , c is true in some preferred model of  $B \cup E$  (e.g., least Herbrand model  $M(B \cup E)$ )
- In ILP, E are ground facts, B are (sets of) general clauses

### Sample problem **Knowledge discovery**

E \*= {daughter(mary,ann),daughter(eve,tom)}
E = {daughter(tom,ann),daughter(eve,ann)}

 $B = \{ mother(ann, mary), mother(ann, tom), \}$  $\begin{array}{ll} & \text{ [mother(ann,mery), mother(ann), female(ann),} \\ & \text{ father(tom,eve), father(tom,ian), female(ann),} \\ & \text{ female(mary), female(eve), male(pat),male(tom),} \\ & \text{ parent(X,Y)} \leftarrow & \text{mother(X,Y), parent(X,Y)} \leftarrow \\ & \text{ father(X,Y)} \end{array}$ 

### Sample problem Knowledge discovery

E \*= {daughter(mary,ann),daughter(eve,tom)}
E \*= {daughter(tom,ann),daughter(eve,ann)}

 $B = \{ mother(ann, mary), mother(ann, tom), father(tom, eve), father(tom, ian), female(ann), female(mary), female(eve), male(pat), male(tom), parent(X,Y) \leftarrow mother(X,Y), parent(X,Y) \leftarrow father(X,Y) \}$ 

• Predictive ILP - Induce a definite clause

 $\texttt{daughter}(\texttt{X},\texttt{Y}) \; \leftarrow \; \texttt{female}(\texttt{X}) \,, \; \texttt{parent}(\texttt{Y},\texttt{X}) \,.$ or a set of definite clauses  $\texttt{daughter}(\texttt{X},\texttt{Y}) \; \leftarrow \; \texttt{female}(\texttt{X}) \,, \; \texttt{mother}(\texttt{Y},\texttt{X}) \,.$  $daughter(X,Y) \leftarrow female(X), father(Y,X).$ 

Descriptive ILP - Induce a set of (general) clauses

← daughter(X,Y), mother(X,Y).  $female(X) \leftarrow daughter(X,Y)$ .  $\texttt{mother}(\mathtt{X},\mathtt{Y}) \; ; \; \; \mathsf{father}(\mathtt{X},\mathtt{Y}) \; \leftarrow \; \mathsf{parent}(\mathtt{X},\mathtt{Y}) \; .$ 

### Sample problem Logic programming

 $E^+ = \{ sort([2,1,3],[1,2,3]) \}$  $E^{-} = \{ sort([2,1],[1]), sort([3,1,2],[2,1,3]) \}$ 

B: definitions of permutation/2 and sorted/1

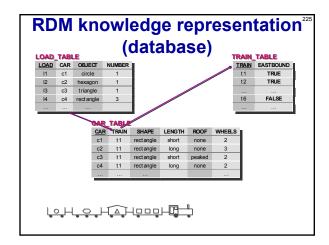

Predictive ILP

 $sort(X,Y) \leftarrow permutation(X,Y), sorted(Y).$ 

· Descriptive ILP

 $sorted(Y) \leftarrow sort(X,Y)$ .  $permutation(X,Y) \leftarrow sort(X,Y)$  $sorted(X) \leftarrow sort(X,X)$ 

### Sample problem: **East-West trains** 1. TRAINS GOING EAS r TV HOOOH T

### **ILP** representation: **Datalog ground facts**

Example: eastbound(t1).

Background theory: car(t1,c1).

car(t1,c2). rectangle(c1). rectangle(c2). short(c1). long(c2). none(c1). none(c2). two\_wheels(c1). three\_wheels(c2). load(c1,I1). load(c2,l2) circle(I1). hexagon(l2) one\_load(I1). one\_load(l2).

car(t1,c3). rectangle(c3). short(c3). load(c3.l3).

triangle(I3).

one\_load(l3).

rectangle(c4). peaked(c3). none(c4). two\_wheels(c3). two\_wheels(c4). load(c4.l4). rectangle(l4). three\_loads(I4).

car(t1,c4).

Hypothesis (predictive ILP): eastbound(T) :- car(T,C), short(C), not none(C).

### **ILP representation: Datalog ground clauses**

• Example: eastbound(t1):-

car(t1,c1),rectangle(c1),short(c1),none(c1),two\_wheels(c1), load(c1,l1),circle(l1),one\_load(l1),

car(t1,c2),rectangle(c2),long(c2),none(c2),three\_wheels(c2), load(c2,l2),hexagon(l2),one load(l2),

car(t1,c3),rectangle(c3),short(c3),peaked(c3),two\_wheels(c3), load(c3,l3),triangle(l3),one\_load(l3), car(t1,c4),rectangle(c4),long(c4),none(c4),two\_wheels(c4), load(c4,l4),rectangle(l4),three\_load(l4).

· Background theory: empty

Hypothesis: eastbound(T):-car(T,C),short(C),not none(C).

### **ILP representation: Prolog terms**

• Example:

eastbound([c(rectangle,short,none,2,l(circle,1)), c(rectangle,long,none,3,l(hexagon,1)), c(rectangle,short,peaked,2,l(triangle,1)), c(rectangle,long,none,2,l(rectangle,3))]).

- Background theory: member/2, arg/3
- Hypothesis:

eastbound(T):-member(C,T),arg(2,C,short), not arg(3,C,none).

### First-order representations

- Propositional representations:
  - datacase is fixed-size vector of values
  - features are those given in the dataset
- First-order representations:
  - datacase is flexible-size, structured object
    - · sequence, set, graph
    - · hierarchical: e.g. set of sequences
  - features need to be selected from potentially infinite set

### **Complexity of RDM problems**

- · Simplest case: single table with primary key
  - example corresponds to tuple of constants
  - attribute-value or propositional learning
- · Next: single table without primary key
  - example corresponds to set of tuples of constants
  - multiple-instance problem
- Complexity resides in many-to-one foreign keys
  - lists, sets, multisets
  - non-determinate variables

### Part V: **Relational Data Mining**

- · Learning as search
- · What is RDM?
- Propositionalization techniques
- · Inductive Logic Programming

### Rule learning: The standard view

- Hypothesis construction: find a set of *n* rules
  - usually simplified by n separate rule constructions
    - · exception: HYPER
- Rule construction: find a pair (Head, Body)
  - e.g. select head (class) and construct body by searching the VersionSpace
    - · exceptions: CN2, APRIORI
- Body construction: find a set of *m* literals
  - usually simplified by adding one literal at a time
    - · problem (ILP): literals introducing new variables

### Rule learning revisited

- Hypothesis construction: find a set of n rules
- Rule construction: find a pair (Head, Body)
- Body construction: find a set of *m* features
  - Features can be either defined by background knowledge or constructed through constructive induction
  - In propositional learning features may increase expressiveness through negation
  - Every ILP system does constructive induction
- **Feature construction**: find a set of *k* literals
- finding interesting features is discovery task rather than classification task e.g. interesting subgroups, frequent itemsets
- excellent results achieved also by feature construction through predictive propositional learning and ILP (Srinivasan)

First-order feature construction

- · All the expressiveness of ILP is in the features
- Given a way to construct (or choose) first-order features, body construction in ILP becomes propositional
  - idea: learn non-determinate clauses with LINUS by saturating background knowledge (performing systematic feature construction in a given language bias)

### Standard LINUS

Example: learning family relationships

Training examples		Background knowledge		
daughter(sue,eve).	(+)	parent(eve, sue).	female(ann).	
daughter(ann,pat).	(+)	parent(ann,tom).	female(sue).	
daughter(tom,ann).	(-)	parent(pat,ann).	female(eve).	
daughter(eve,ann).	(-)	parent(tom,sue).		

Transformation to propositional form:

Class	Varia	ables	Propositional features						
	Х	Υ	f(X)	f(X) f(Y) p(X,X) p		p(X,Y)	p(Y,X)	p(Y,Y)	X=Y
0	sue	eve	true	true	false	false	true	false	false
0	ann	pat	true	false	false	false	true	false	false
θ	tom	ann	false	true	false	false	true	false	false
θ	eve	ann	true	true	false	false	false	false	false

- Result of propositional rule learning:
  - Class =  $\oplus$  if (female(X) = true)  $\wedge$  (parent(Y,X) = true
- Transformation to program clause form:  $daughter(X,Y) \leftarrow female(X),parent(Y,X)$

Representation issues (1)

- · In the database and Datalog ground fact representations individual examples are not easily separable
- · Term and Datalog ground clause representations enable the separation of individuals
- Term representation collects all information about an individual in one structured term

### Representation issues (2)

- · Term representation provides strong language bias
- · Term representation can be flattened to be described by ground facts, using
  - structural predicates (e.g. car(t1,c1), load(c1,l1)) to introduce substructures
  - utility predicates, to define properties of invididuals (e.g. long(t1)) or their parts (e.g., long(c1), circle(l1)).
- · This observation can be used as a language bias to construct new features

**Declarative bias for first-order** feature construction

- · In ILP, features involve interactions of local variables
- Features should define properties of individuals (e.g. trains, molecules) or their parts (e.g., cars, atoms)
- Feature construction in LINUS, using the following language
  - one free global variable (denoting an individual, e.g. train)
  - one or more structural predicates: (e.g., has car(T,C)), each introducing a new existential local variable (e.g. car, atom), using either the global variable (train, molecule) or a local variable introduced by other structural predicates (car, load)

    one or more utility predicates defining properties of individuals or their parts: no new variables, just using variables

  - all variables should be used
  - parameter: max. number of predicates forming a feature

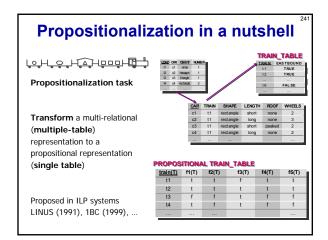

Sample first-order features

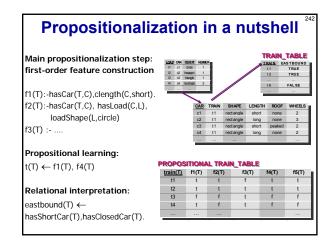

- The following rule has two features 'has a short car' and 'has a closed car':
- eastbound(T):-hasCar(T,C1),clength(C1,short), hasCar(T,C2),not croof(C2,none).
- The following rule has one feature 'has a short closed car': eastbound(T):-hasCar(T,C),clength(C,short), not croof(C,none).
- Equivalent representation:

eastbound(T):-hasShortCar(T),hasClosedCar(T).

hasShortCar(T):-hasCar(T,C),clength(C,short).

 $hasClosedCar(T):-hasCar(T,C), not\ croof(C, none).$ 

### **LINUS** revisited

- · Standard LINUS:
  - transforming an ILP problem to a propositional problem
  - apply background knowledge predicates
- Revisited LINUS:
  - Systematic first-order feature construction in a given language bias
- · Too many features?
  - use a relevancy filter (Gamberger and Lavrac)

### LINUS revisited: **Example: East-West trains**

Rules induced by CN2, using 190 first-order features with up to two utility predicates:

eastbound(T):-

hasCarHasLoadSingleTriangle(T),

not hasCarLongJagged(T),

not hasCarLongHasLoadCircle(T). Meaning:

westbound(T):not hasCarEllipse(T), not hasCarShortFlat(T),

not hasCarPeakedTwo(T)

eastbound(T):-

has Car(T,C1), has Load(C1,L1), Ishape(L1,tria), Inumber(L1,1),not (hasCar(T,C2),clength(C2,long),croof(C2,jagged)),

 $not\ (has Car(T,C3),has Load(C3,L3),clength(C3,long),lshape(L3,circ)).$ westbound(T):-

not (hasCar(T,C1),cshape(C1,ellipse)),

not (hasCar(T,C2),clength(C2,short),croof(C2,flat)),

not (hasCar(T,C3),croof(C3,peak),cwheels(C3,2)).

### Part V: **Relational Data Mining**

- · Learning as search
- · What is RDM?
- · Propositionalization techniques

Inductive Logic Programming

### ILP as search of program clauses

- · An ILP learner can be described by
  - the structure of the space of clauses
    - · based on the generality relation
    - Let C and D be two clauses. C is more general than D (C  $\models$  D) iff  $\overline{\mathsf{covers}(\mathsf{D})} \subseteq \overline{\mathsf{covers}(\mathsf{C})}$
    - Example:  $p(X,Y) \leftarrow r(Y,X)$  is more general than  $p(X,Y) \leftarrow r(Y,X),\, q(X)$
  - its search strategy
    - · uninformed search (depth-first, breadth-first, iterative
    - · heuristic search (best-first, hill-climbing, beam search)
  - its heuristics
    - · for directing search
    - for stopping search (quality criterion)

### ILP as search of program clauses

Semantic generality

Hypothesis  $H_1$  is semantically more general than  $H_2$  w.r.t. background theory B if and only if  $B \cup H_1 \models H_2$ 

Syntactic generality or θ-subsumption

(most popular in ILP)

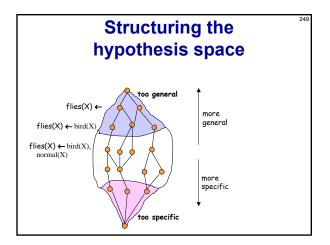

- Clause  $c_1$   $\theta$ -subsumes  $c_2$  ( $c_1 \ge \theta c_2$ )
- if and only if  $\exists \theta : c_1 \theta \subseteq c_2$ - Hypothesis  $H_1 \ge \theta H_2$
- if and only if  $\forall c_2 \in \overline{H_2}$  exists  $c_1 \in H_1$  such that  $c_1 \ge \theta c_2$

Example

c1 = daughter(X,Y)  $\leftarrow$  parent(Y,X) c2 = daughter(mary,ann)  $\leftarrow$  female(mary),  $\begin{array}{c} \text{parent(ann,mary),} \\ \text{parent(ann,tom).} \\ \text{c1 $\theta$-subsumes $c_2$ under $\theta$= {X/mary,Y/ann}} \end{array}$ 

### The role of subsumption in ILP

- · Generality ordering for hypotheses
- · Pruning of the search space:
  - generalization
    - if C covers a neg. example then its generalizations need not be considered
  - specialization
    - if C doesn't cover a pos. example then its specializations need not be considered
- · Top-down search of refinement graphs
- · Bottom-up search of the hypo. space by
  - building least general generalizations, and
  - inverting resolutions

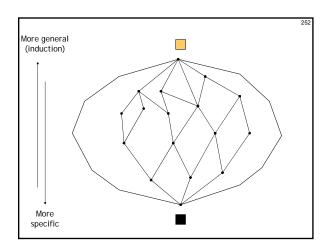

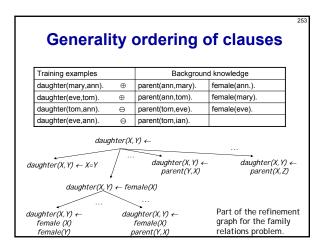

### Two strategies for learning

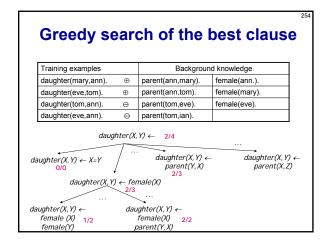

- · General-to-specific
  - if Θ-subsumption is used then refinement operators
- · Specific-to-general search
  - if ⊕-subsumption is used then lgg-operator or generalization operator

ILP as search of program clauses

- Two strategies for learning
  - Top-down search of refinement graphs
  - Bottom-up search
    - · building least general generalizations
    - inverting resolution (CIGOL)
    - inverting entailment (PROGOL)

### **FOIL**

 Language: function-free normal programs recursion, negation, new variables in the body, no functors, no constants (original)

· Algorithm: covering

· Search heuristics: weighted info gain

· Search strategy: hill climbing

• Stopping criterion: encoding length restriction

- Search space reduction: types, in/out modes determinate literals
- Ground background knowledge, extensional coverage
- · Implemented in C

### **Part V: Summary**

- RDM extends DM by allowing multiple tables describing structured data
- Complexity of representation and therefore of learning is determined by one-to-many links
- Many RDM problems are individual-centred and therefore allow strong declarative bias
