# Data Mining and Knowledge Discovery: Practice Notes

Petra Kralj Novak

Petra.Kralj.Novak@ijs.si 2011/12/04

# Keywords

#### Data

Attribute, example, attribute-value data, target variable, class, discretization

#### Data mining

 Heuristics vs. exhaustive search, decision tree induction, entropy, information gain, overfitting, Occam's razor, model pruning, naïve Bayes classifier, KNN, association rules, support, confidence, predictive vs. descriptive DM, numeric prediction, regression tree, model tree

#### Evaluation

 Train set, test set, accuracy, confusion matrix, cross validation, true positives, false positives, ROC space, error

## Practice plan

- 2012/11/20: Predictive data mining 1
  - Decision trees
  - Evaluating classifiers 1: separate test set, confusion matrix, classification accuracy
  - Hands on Weka 1: Just a taste of Weka
- 2012/12/4: Predictive data mining 2
  - Discussion about decision trees
  - Naïve Bayes classifier
  - Evaluating classifiers 2: Cross validation
  - Numeric prediction
  - Hands on Weka 2: Classification and numeric prediction
- 2012/12/4: Descriptive data mining
  - Discussion on classification
  - Association rules
  - Hands on Weka 3: Descriptive data mining
  - Discussion about seminars and exam
- 2013/1/15: Written exam, seminar proposal discussion
- 2013/2/12: Data mining seminar presentations

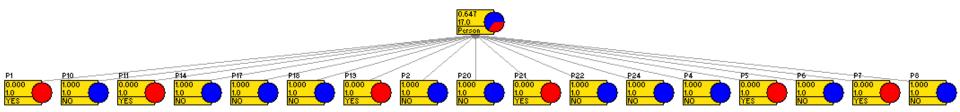

## Discussion about decision trees

- → How much is the information gain for the "attribute" Person? How would it perform on the test set?
  - How do we compute entropy for a target variable that has three values? Lenses = {hard=4, soft=5, none=13}
  - What would be the classification accuracy of our decision tree if we pruned it at the node Astigmatic?
  - What are the stopping criteria for building a decision tree?
  - How would you compute the information gain for a numeric attribute?

# Information gain of the "attribute" Person

#### On training set

- As many values as there are examples
- Each leaf has exactly one example
- E(1/1, 0/1) = 0 (entropy of each leaf is zero)
- The weighted sum of entropies is zero
- The information gain is maximum (as much as the entropy of the entire training set)

#### On testing set

 The values from the testing set do not appear in the tree

## Discussion about decision trees

- How much is the information gain for the "attribute" Person? How would it perform on the test set?
- → How do we compute entropy for a target variable that has three values? Lenses = {hard=4, soft=5, none=13}
  - What would be the classification accuracy of our decision tree if we pruned it at the node *Astigmatic*?
  - What are the stopping criteria for building a decision tree?
  - How would you compute the information gain for a numeric attribute?

## Entropy{hard=4, soft=5, none=13}=

- = E(4/22, 5/22, 13/22)
- $= -\sum p_i * \log_2 p_i$
- $= -4/22 * \log_2 4/22 5/22 * \log_2 5/22 13/22* \log_2 13/22$
- = 1.38

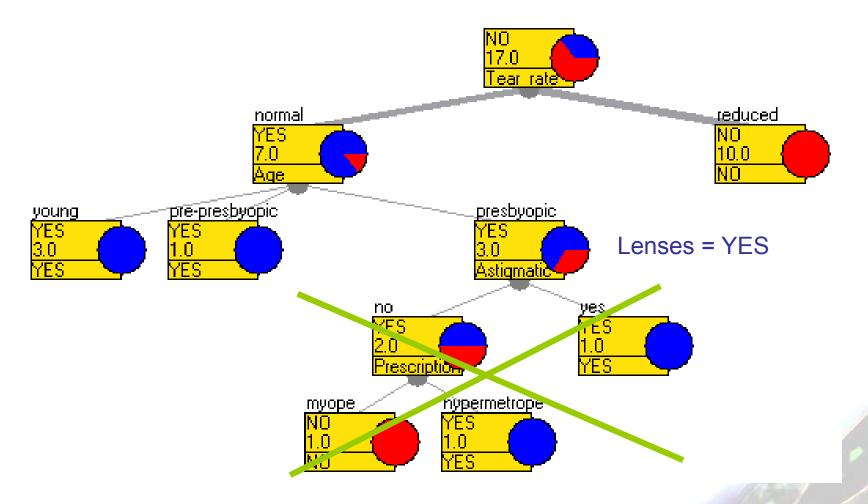

## Discussion about decision trees

- How much is the information gain for the "attribute" Person? How would it perform on the test set?
- How do we compute entropy for a target variable that has three values? Lenses = {hard=4, soft=5, none=13}
- → What would be the classification accuracy of our decision tree if we pruned it at the node Astigmatic?
  - What are the stopping criteria for building a decision tree?
  - How would you compute the information gain for a numeric attribute?

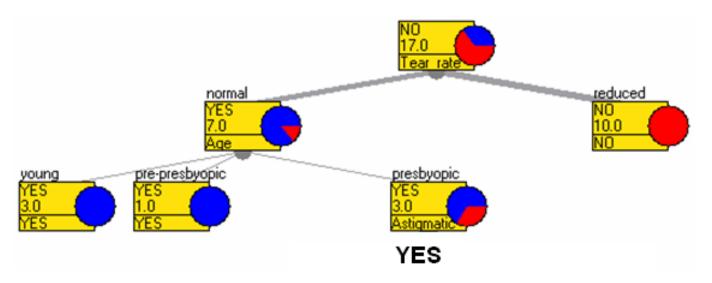

## Decision tree pruning

# These two trees are equivalent

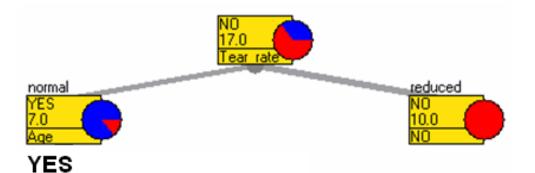

# Classification accuracy of the pruned tree

Person	Age	Prescription	Astigmatic	Tear_rate	Lenses
P3	young	hypermetrope	no	normal	YES
P9	pre-presbyopic	myope	no	normal	YES
P12	pre-presbyopic	hypermetrope	no	reduced	NO
P13	pre-presbyopic	myope	yes	normal	YES
P15	pre-presbyopic	hypermetrope	yes	normal	NO
P16	pre-presbyopic	hypermetrope	yes	reduced	NO
P23	presbyopic	hypermetrope	yes	normal	NO

$$Ca = (3+2)/(3+2+2+0) = 71\%$$

	Predicted positive	Predicted negative
Actual positive	TP=3	FN=0
Actual negative	FP=2	TN=2

## Discussion about decision trees

- How much is the information gain for the "attribute" Person? How would it perform on the test set?
- How do we compute entropy for a target variable that has three values? Lenses = {hard=4, soft=5, none=13}
- What would be the classification accuracy of our decision tree if we pruned it at the node Astigmatic?
- → What are the stopping criteria for building a decision tree?
  - How would you compute the information gain for a numeric attribute?

#### Stopping criteria for building a decision tree

- ID3
  - "Pure" nodes (entropy =0)
  - Out of attributes
- J48 (C4.5)
  - Minimum number of instances in a leaf constraint

## Discussion about decision trees

- How much is the information gain for the "attribute" Person? How would it perform on the test set?
- How do we compute entropy for a target variable that has three values? Lenses = {hard=4, soft=5, none=13}
- What would be the classification accuracy of our decision tree if we pruned it at the node Astigmatic?
- What are the stopping criteria for building a decision tree?
- → How would you compute the information gain for a numeric attribute?

## Predicting with Naïve Bayes

#### Given

Attribute-value data with nominal target variable

#### Induce

 Build a Naïve Bayes classifier and estimate its performance on new data

## Naïve Bayes classifier

$$P(c \mid a_1, a_2, .... a_n) = P(c) \prod_i \frac{P(c \mid a_i)}{P(c)}$$

Assumption: conditional independence of attributes given the class.

#### Will the spider catch these two ants?

- Color = white, Time = night
- Color = black, Size = large, Time = day

$\operatorname{Color}$	Size	Time	Caught
black	large	day	YES
white	$\operatorname{small}$	night	YES
black	$\operatorname{small}$	day	YES
$\operatorname{red}$	large	night	NO
black	large	night	NO
white	large	night	NO

# Naïve Bayes classifier -example

$\operatorname{Color}$	Size	Time	Caught
black	large	day	YES
white	$\operatorname{small}$	night	YES
black	$\operatorname{small}$	day	YES
red	large	night	NO
black	large	night	NO
white	large	night	NO

$$v_1 = "Color = white"$$
  
 $v_2 = "Time = night"$   
 $c_1 = YES$   
 $c_2 = NO$ 

$$p(c_1|v_1,v_2) = \\ p(Caught = YES|Color = white, Time = night) = \\ p(Caught = YES) * \frac{p(Caught = YES|Color = white)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES)}{p(Caught = YES)} * \frac{p(Caught = YES|Time = night)}{p(Caught = YES)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YES|Time = night)} = \\ \frac{p(Caught = YES|Time = night)}{p(Caught = YE$$

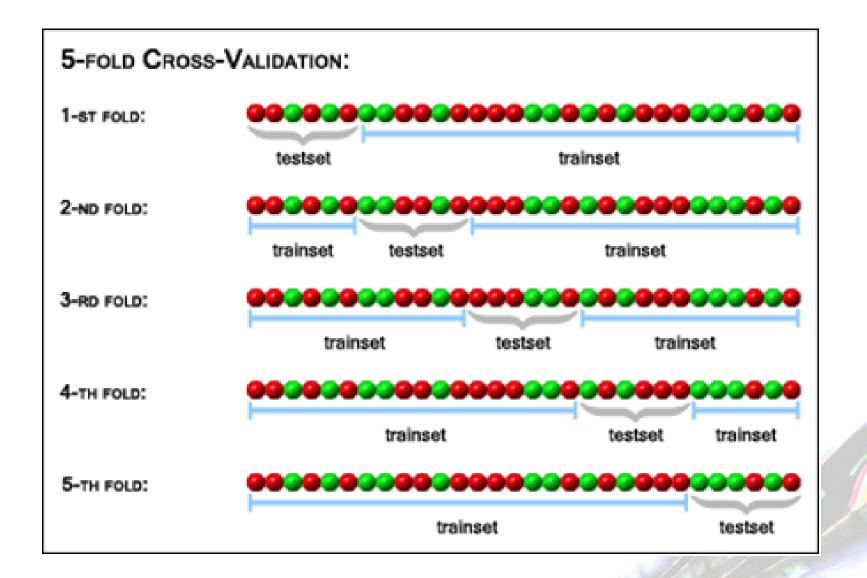

$$\frac{1}{2} * \frac{\frac{1}{2}}{\frac{1}{2}} * \frac{\frac{1}{4}}{\frac{1}{2}} = \frac{1}{4}$$

## K-fold cross validation

- 1. The sample set is partitioned into K subsets ("folds") of about equal size
- Of the K subsets, a single subset is retained as the validation data for testing the model (this subset is called the "testset"), and the remaining K - 1 subsets together are used as training data ("trainset").
- 3. A model is trained on the trainset and its accuracy (or other performance measure) is evaluated on the testset
- 4. Model training and evaluation is repeated K times, with each of the K subsets used exactly once as the testset.
- 5. The average of all the accuracy estimations obtained after each iteration is the resulting accuracy estimation.

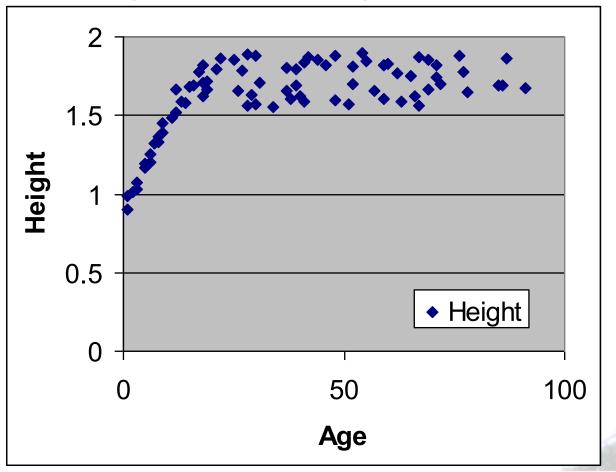

# Numeric prediction

# Example

data about 80 people:
 Age and Height

Age	Height
3	1.03
5	1.19
6	1.26
9	1.39
15	1.69
19	1.67

Decision trees, Naïve Linear regression, regression trees,... Bayes, ...

#### **Baseline predictor: Baseline predictor:**

Mean of the target Majority class variable

#### Discussion

- Compare naïve Bayes and decision trees (similarities and differences).
- 2. Can KNN be used for classification tasks?
- 3. Compare KNN and Naïve Bayes.
- 4. Compare decision trees and regression trees.
- 5. Consider a dataset with a target variable with five possible values:
  - 1. non sufficient
  - 2. sufficient
  - 3. good
  - 4. very good
  - 5. excellent
  - 1. Is this a classification or a numeric prediction problem?
  - 2. What if such a variable is an attribute, is it nominal or numeric?
- 6. Compare cross validation and testing on a different test set.
- 7. Why do we prune decision trees?
- 8. List 3 numeric prediction methods.
